To:

Mr. James (JD) Dotchin, Chief
Nevada Division of Environmental Protection
901 South Stewart Street – 4th Floor
Carson City, Nevada 89701

Ref: Application for Renewal of the BRC CAMU

Dear Mr. Dotchin,

BRC hereby submits the attached updated application for the BRC CAMU located in Henderson, NV. This permit reflects the as-built, closed conditions of the CAMU.

The BRC CAMU was constructed in Phases, per the original NDEP-approved design. The CAMU consists of liner Phases I, II, IIIA, IIIB, IV, and V and closure cover phases I, II, and III. In addition, the North and South BMI Landfills were closed concurrently with BRC CAMU construction.

Since the next term of the RAP will consist of post-closure activities, this document reflects activities which occurred during construction and post-closure activities that will be performed in the next term. We have kept the format of this application consistent with the prior application for ease of review, including prior Attachment numbering. When relevant, we have revised existing Attachments and/or provided new Attachments.

Specifically, with regards to final design drawings, for ease of reference and in order to avoid a substantial effort associated with reissuance of drawings that have already previously been approved by the NDEP, we have provided the entire set of final design documents in this application.

A Long Term Groundwater Monitoring Plan for the CAMU was prepared and agreed to by the NDEP Bureau of Corrective Actions (BCA). The Long Term Groundwater Monitoring Plan is included as Attachment Y.

With regards to future land use on the final cover of the CAMU, as the NDEP is aware, a solar collection field is planned for installation. This system will be installed and maintained by a party other than BRC, subject to a land lease agreement with BRC. The land lease between BRC and the parties will include all applicable conditions of the RAP. Whomever the solar operator may be, they will separately obtain the necessary approvals and permits to install and operate the solar field (including such permits as may be necessary from the NDEP), BRC's CAMU design engineer Geosyntec will review any proposed design to ensure it is in conformance with the CAMU cover design (Attachment AA). Attachment AA provides guidance to any solar field design for the installation and operation of a Solar field. Attachment AB provides a placeholder in which the details of the solar field design documents are located. Currently, this includes documents which have been submitted to the NDEP for review.

It is BRC's understanding, based on conversations with the NDEP, that there is no special format for this application and no forms, etc. as such. As noted above, we have updated the application materials as needed, based on relevance going forward.

Finally, we request that the NDEP issue the updated RAP, deleting conditions in the current version that are no longer appropriate for the next term.

Should you have any questions, please call me at 702.567.0400.

Lee C. Farris

Mr. Lee C. Farris, P.E.
Vice-President

CERTIFICATIONS AND JURAT

I hereby certify that I am responsible for the services described in this document and for the preparation of this document. The services described in this document have been provided in a manner consistent with the current standards of the profession and to the best of my knowledge comply with all applicable federal, state and local statutes, regulations and ordinances. I hereby certify that all laboratory analytical data was generated by a laboratory certified by the NDEP for each constituent and media presented herein.

Dr. Ranajit Sahu, C.E.M. (No. EM-1699, Exp. 10/07/2021)
BRC Project Manager

I certify under penalty of law that this document and all attachments were prepared under my direction or supervision according to a system designed to assure that qualified personnel properly gather and evaluate the information submitted. Based on my inquiry of the person or persons who manage the system, or those persons directly responsible for gathering the information, the information submitted is, to the best of my knowledge and belief, true, accurate, and complete. I am aware that there are significant penalties for submitting false information, including the possibility of fine and imprisonment for knowing violations.

Mr. Mark Paris
President and CEO, BRC

1.0 INTRODUCTION

Basic Remediation Company (BRC) has prepared and submits this application for the update of the current Remedial Action Plan (RAP) permit (Attachment W) to perform post-closure maintenance on a Remediation Waste Management System (RWMS) in Clark County, Nevada. Previous versions of this document were submitted to the Nevada Division of Environmental Protection (NDEP) in April 2015 and April 2018 by BRC's design engineer, Geosyntec Consultants. The previous version is included as Attachment W. This document includes the application and supporting documentation for the Corrective Action Management Unit (CAMU), hereafter referred to as the BRC CAMU. This permit application is being submitted to the NDEP, Carson City, Nevada.

This application provides the information needed to obtain a RAP as specified in 40 CFR 270, Subpart H. In this context, a RAP is defined as a special form of RCRA permit that authorizes the disposal of remediation waste at a remediation waste management site. This type of permit was developed as part of the Hazardous Waste Identification Rule for Contaminated Media, or "HWIR-media rule" (63 FR 65874). As stated in the United States Environmental Protection Agency (USEPA) Environmental Fact Sheet on the Final HWIR-Media Rule (EPA530-F-98-029), this rule is designed to eliminate existing regulatory disincentives to remediation, make site cleanup faster and easier, and, thus, provide increased protection to human health and the environment.

Previous applications were prepared to authorize the unit to receive remediation waste and authorize the post-closure operation of the unit; this application has been prepared to re-authorize the post-closure operation of the unit. The unit is conservatively designed and will be operated to meet the regulatory requirements for a CAMU, as referred to in 40 CFR 264.552.

As noted in the prior application, the purpose of the BRC CAMU is to provide a permitted disposal facility at the NDEP-approved location (per the Record of Decision dated 2 November 2001) for wastes generated during the voluntary cleanup of certain areas of the BMI Common Areas (the "Site"), as specifically contemplated by the "Nevada Division of Environmental Protection Settlement Agreement and Order on Consent: BMI Common Areas, Phase 3" (the "AOC3") dated February 15, 2006, and as defined in the Corrective Action Plan (CAP) (BRC, 2006). Portions of the Site have been impacted during the legal disposal of various materials, including industrial wastes and cooling waters. The NDEP provides oversight of the voluntary cleanup activities.

As a result of the NDEP's review of the "Remedial Alternatives Study (RAS) for the BMI Common Areas" (ERM, 1999), and subsequent discussion with BRC, the location stated in remedial alternative 4B was approved as the preferred location of waste materials generated from the voluntary cleanup of the Site. The actual text of the NDEP's comment is provided below for reference.

"Per discussions with Basic Remediation Company (Robin Bain) on August 5, 1999, the Division assumes this alternative (4B in the RAS) has been modified to locate soils within the confines of BMI property immediately surrounding the current BMI Landfill. Based on currently available information, co-location of impacted soils with the BMI Landfill is the current preference of the Division for soil disposal."

The BRC CAMU was constructed in Phases, per the original NDEP-approved design. The CAMU consists of Phases I, II, IIIA, IIIB, IV, and V. The following Construction Quality Assurance (CQA) Reports for these Phases were submitted to NDEP and approved:

- Phase I Construction Quality Assurance Report, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated September 2008. (Phase I Liner CQA Report)
- Phase II Construction Quality Assurance Report, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated December 2008. (Phase II Liner CQA Report)
- Phase IIIA Construction Quality Assurance Report, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated March 2009. (Phase IIIA Liner CQA Report)
- Phase IIIB Construction Quality Assurance Report, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated May 2009. (Phase IIIB Liner CQA Report)
- Phase IV Construction Quality Assurance Report, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated July 2009. (Phase IV Liner CQA Report)
- Phase V Construction Quality Assurance Report, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated September 2009. (Phase V Liner CQA Report)

The CAMU was closed in three Phases. The following Closure documents for these Phases were submitted to the NDEP and approved:

- CAMU Partial Final Closure Construction Quality Assurance Report, Phases IIIA & Portion of Phase II, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated April 2010. (Closure I CQA Report)
- CAMU Partial Final Closure Construction Quality Assurance Report, Phases I, IIIB, IV, & Portions of Phases II and V, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated May 2010. (Closure II CQA Report)
- CAMU Final Closure Construction Quality Assurance Report, Phase V, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated April 2015. (Closure III CQA Report)

In addition, the North and South BMI Landfills were closed during construction of the BRC CAMU. The following closure documents for these landfills were submitted to NDEP and approved:

- South BMI Closure Construction Quality Assurance Report, BMI Common Areas Remediation Project, prepared by Geosyntec Consultants, Inc. dated June 2010
- North BMI Partial Final Closure Construction Quality Assurance Report, BMI Common Areas Remediation Project, prepared by Geosyntec Consultants, Inc. dated June 2010
- Addendum to North BMI Partial Final Closure Construction Quality Assurance Report, BMI Common Areas Remediation Project, prepared by Geosyntec Consultants, Inc. dated April 2015

As such, ongoing activities for these Phases consist of inspection and maintenance.

The RAP is currently a post-closure document. For reference, we have retained construction and closure related documents in this application; however, we have updated the Attachments to reflect the post-closure operating conditions at the CAMU. We have kept the format of this application consistent with the prior

application for ease of review, including prior Attachment numbering. When relevant we have revised existing Attachments and/or provided new Attachments.

A Long Term Groundwater Monitoring Plan for the CAMU was prepared and agreed to by the NDEP Bureau of Corrective Actions (BCA). The Long Term Groundwater Monitoring Plan is included as Attachment Y.

With regards to future land use on the final cover of the CAMU, as the NDEP is aware, a solar collection field is planned for installation. This system will be installed and maintained by a party other than BRC, subject to a land lease agreement with BRC. The land lease between BRC and the parties will include all applicable conditions of the RAP. Whomever the solar operator may be, they will separately obtain the necessary approvals and permits to install and operate the solar field (including such permits as may be necessary from the NDEP), BRC's CAMU design engineer Geosyntec will review any proposed design to ensure it is in conformance with the CAMU cover design (Attachment AA). Attachment AA provides guidance to any solar field design for the installation and operation of a Solar field. Attachment AB provides a placeholder in which the details of the solar field design documents are located. Currently, this includes documents which have been submitted to the NDEP for review.

It is BRC's understanding, based on conversations with the NDEP, that there is no special format for this application and no forms, etc. as such. As noted above, we have updated the application materials as needed, based on relevance going forward.

Finally, we request that the NDEP issue the revised RAP, deleting conditions in the current version that are no longer appropriate for the next term.

2.0 BACKGROUND

The BRC CAMU is located within Sections 11 and 12 of Township 22 South, Range 62 East, approximately 10,000 feet west-northwest of the intersection of Lake Mead Drive and Boulder Highway and approximately 3,500 feet west-southwest of intersection of Warm Springs Road and Boulder Highway (Attachment A). The site is approximately 13 miles south of the City of Las Vegas. The BRC CAMU is located within the boundaries of the BMI Common Areas and is bordered on the north, east, and south by the BMI Industrial Complex. The BMI Industrial Complex consists of four operational plants west of Boulder Highway and north of Lake Mead Drive.

The BRC CAMU, which is approximately 55 acres, is located within a 113-acre area northwest of the active plant area of the BMI Complex (Attachment B). The separate, distinct, and existing BMI Landfills (BMI North and BMI South) occupy approximately 66 acres of this area and was initially used as effluent disposal ponds for the Basic Magnesium, Inc. magnesium refinery since its inception. Following shut-down of the refinery in November 1944, the two western-most ponds were converted to a solid waste disposal area which became known as the BMI Landfill. Use of this Landfill continued by successor operations until its closure in February 1980.

Immediately to the south of the BMI North Landfill, a series of slit trenches were excavated during the 1950s through 1970s. A range of refuse and industrial wastes were placed into these slit trenches, the use of which was discontinued prior to 1980. Under NDEP oversight, these wastes have been removed and placed within the CAMU in Phases II, IIIB, and IV as part of the construction of these Phases under the terms of the current RAP.

3.0 OVERVIEW

The BRC CAMU was constructed between July 2008 and January 2015. As described previously, it was constructed in five phases and closed in three phases. Beginning in January 2015, the CAMU entered its post-closure care period in accordance with AOC3. Concurrent with CAMU construction, the North and South BMI Landfills were closed.

This permit application addresses the requirements for a RAP, as specified in 40 CFR 270. Table 1 of this permit application includes introductory material and citations of where each regulatory requirement is addressed in this application package.

Attachment I contains site location information. Attachment R provides documentation of financial assurance.

Plans relating to Waste Characterization, Monitoring Programs, and Post-Closure are presented in Attachments C, N, and O respectively. The final design documents for the BRC CAMU are provided in Attachment P. Attachment C also includes a general discussion of the waste material disposed of in the CAMU as well as provides summary tables of analytical data for these waste source areas.

A geotechnical evaluation of the site is presented in Section 8 of the SRAPI. The geotechnical study encompasses the CAMU (Borings B1 through B-12 and B-102) and Basic Environmental Company (BEC) property immediately to the west and northwest of the CAMU. In addition, boring logs for slit trench investigation work are presented in Section 8 of the SRAPI.

Attachment O includes discussion of the BRC CAMU Closure Plan with design parameters for the final cover along with supporting infiltration modeling information and conceptual design of the Final Cover System.

Attachment AE includes the proposed revision to the leachate management system. Currently, leachate is removed from the sumps and transported to an offsite permitted facility for disposal. In the future, the leachate management system may be comprised of a 5,500 gallon (gal) double-walled high density linear polyethylene (HDLPE) tank and associated piping located at the north side of the BMI North landfill. The HDLPE tank would be supported on a concrete pad.

It should be noted that a solar collection field is planned for installation on top of the cover. This system will be installed and maintained by a party other than BRC, subject to a land lease agreement with BRC. The land lease between BRC and the parties will include all applicable conditions of the RAP. Whomever the solar operator may be, they will separately obtain the necessary approvals and permits to install and operate the solar field (including such permits as may be necessary from the NDEP), BRC's CAMU design engineer Geosyntec will review any proposed design to ensure it is in conformance with the CAMU cover design (Attachment AA). Attachment AA provides guidance to any solar field design for the installation and operation of a Solar field. Attachment AB provides a placeholder in which the details of the solar field design documents are located. Currently, this includes documents which have been submitted to the NDEP for review.

4.0 REQUIRED INFORMATION

This section outlines the information required for a RAP application, as specified in 63 FR 65942 and 40 CFR 270.110. For those requirements that call for detailed explanation or the use of drawings, reference is provided to the appropriate section or drawing within this document. Table 1 is provided as an outline of applicable regulatory requirements, with references to pertinent sections of this RAP application.

The following is a list of the RAP application questions and associated responses:

(a) The name, address, and USEPA identification number of the remediation waste management site;

BRC CAMU, Clark County, 22S/62E/11 and 12; EPA ID# NVR000082255

(b) The name, address, and telephone number of the owner and operator;

Basic Remediation Company, 875 West Warm Springs Road, Henderson, Nevada; Phone: 702-567-0400

(c) The latitude and longitude of the site;

Latitude: 36D 02M 56.23S N (36.048953 decimal degrees)
Longitude: 115D 00M 47.51S W (-115.013197 decimal degrees)

(d) The United States Geological Survey (USGS), or county map, showing the location of the remediation waste management site;

The BRC CAMU site is located on the USGS Las Vegas SE, Nevada, Clark County quadrangle map. The site location is shown on Attachment A.

(e) A scaled drawing of the remediation waste management site showing:
1. The remediation waste management site boundaries;
2. Any significant physical structures; and
3. The boundary of all areas on-site where remediation waste is to be treated, stored, or disposed.

A scaled drawing showing all the required information is provided as Attachment B.

(f) A specification of the remediation waste to be treated, stored or disposed of at the facility or remediation waste management site. This must include information on:

1. Constituent concentrations and other properties of the remediation wastes that may affect how such materials should be treated and/or otherwise managed;

   Properties and constituent concentrations of the waste materials placed in the BRC CAMU are provided in Attachment C of this document, entitled "Waste Analysis Plan".

2. An estimate of the quantity of these wastes; and

   Based on project completion quantities (Geosyntec 2010, Geosyntec 2010a, and Geosyntec 2015), a total of 3.725 million cubic yards of waste materials were placed within the CAMU.

3. A description of the processes you will use to treat, store, or dispose of this waste, including technologies, handling systems, design and operating parameters you will use to treat hazardous remediation wastes before disposing of them according to the Land Disposal Restrictions (LDR) standards of part 268 of this chapter, as applicable.

   The process used in handling and disposal of the waste is outlined in Attachments C through P of this RAP permit application.

(g) Enough information to demonstrate that operations that follow the provisions in your RAP application will ensure compliance with applicable requirements of parts 264, 266, and 268 of this chapter;

Table 1 is provided as an outline of the applicable regulatory requirements, with references to pertinent sections of this RAP application, which demonstrate compliance.

(h) Such information as may be necessary to enable the Regional Administrator to carry out his duties under other Federal laws, as is required for traditional RCRA permits under 270.14(b)(20);

This RAP permit application is intended to provide sufficient information to enable the Regional Administrator to carry out his/her duties under other Federal Law, as is required for traditional RCRA permits under 270.14(b)(20).

(i) Any other information the Director decides is necessary for demonstrating compliance with this subpart or for determining any additional RAP conditions that are necessary to protect human health and the environment.

This RAP permit application is intended to provide sufficient information regarding siting, design, and operation to determine compliance with RAP conditions that are necessary to protect human health and the environment.

1.0 INTRODUCTION

The Basic Remediation Company (BRC) site-related chemicals (SRC) list, as approved by the Nevada Division of Environmental Protection (NDEP), currently includes a wide range of analytes, including many chemicals with universal treatment standards (UTS), as defined in Code of Federal Regulations (CFR) Title 40, Chapter 268.48 (40 CFR 268.48). The UTS list, with those constituents on the BRC SRC list identified, is shown in Table C-1. All areas where wastes were present or may have been present based on visual evidence and an understanding of the Conceptual Site Model (CSM), along with measured or anticipated waste depths, are shown on Figure C-1. Although additional remediation was required in areas not shown in order to meet project risk goals, wastes were not present in discernable quantities in other areas; therefore, sampling in areas not shown as containing wastes in Figure C-1 would not provide a realistic representation of waste composition (i.e., any samples collected will be unavoidably diluted with non-waste soils, thus rendering them unrepresentative of waste materials). Although sporadic waste sampling efforts have been conducted in the past within the BMI Common Areas, the recent Waste Sampling and Analysis effort in 2006 was a systematic attempt to characterize the wastes present in the Common Areas. The 2006 round of sampling also utilized the final SRC list for the BMI Common Areas, thereby providing the largest number of analytes for analysis. Thus, this 2006 sampling provides the most complete characterization of the wastes and is summarized in this Attachment. It should be noted, however, that because these waste sampling results reflect the condition of the wastes as they were present in the source areas, there is likely to be some unavoidable commingling of wastes and non-waste materials during removal actions leading to dilution – thus, the characteristics of the wastes placed in the CAMU may therefore be somewhat different. In this respect the results presented and discussed in this Attachment are conservative.

2.0 INVESTIGATIVE HISTORY

The 2006 waste characterization investigation, pursuant to an approved workplan by NDEP, focused on areas within the BMI Common Areas (Eastside) where wastes are located. Each of the samples collected from these areas was a composite grab sample in order to provide a representative concentration of the wastes present. Details of this compositing approach are shown in Table C-2 and Figure C-2, and Figures C-3A through C-3C.

The methodology for the solid matrix samples and waste water sample were in accordance with the project Field Sampling and Standard Operating Procedures (FSSOP; BRC and MWH 2006a) for surface and subsurface soil sample collection, including pre-field activities. The project Health and Safety Plan (HSP; BRC and MWH 2005) and Quality Assurance Project Plan (QAPP; BRC and MWH 2006b) prepared for the BMI

Common Areas were also used for this work. All work was completed under the direction of a State of Nevada Certified Environmental Manager (CEM).

The vast majority of the wastes present were soils and sediments; however, for completeness BRC also sampled the only wastewater present – namely in the TIMET Pond SW-12. This pond and the other TIMET ponds were no longer in service and the free water contained therein was evaporating. The primary purpose of the sampling effort was to (a) complete characterization of the remedial wastes in order to address certain regulatory requirements pertaining to their anticipated excavation and placement into the proposed CAMU; and (b) to assist with continued development of the BMI Common Areas (Eastside) CSM.

Waste characterization was performed to determine whether excavated materials comply with minimum treatment requirements (MTRs) prior to placement into a land disposal unit. As such the Waste Sampling and Analysis Plan (BRC, 2006) that was prepared and approved by the NDEP, with incorporated comments, complied with and was intended to support regulations at 40 CFR 270.110(f); 40 CFR 264(1)(j)(2); 40 CFR 264.552(d); 40 CFR 264.552(e)(2)&(4); and 40 CFR 268.49 (U.S. Environmental Protection Agency [USEPA] 2005).

Samples were collected from the following areas:

- Alpha ditch: composite samples were collected from three locations along the length of the alpha ditch. Each of the three sample locations consisted of composite samples from three equidistant locations (50 feet apart) and from two depths each.
- Beta ditch: composite samples were collected from three locations along the length of the beta ditch. Each of the three sample locations consisted of composite samples from three equidistant locations (50 feet apart) and from three depths each.
- IRM soil holding ponds: a single composite sample was collected from each of the IRM holding ponds – these are seven of the Upper Ponds. Each IRM holding pond sample consisted of composite samples from two locations within the holding pond and from two depths each. Since these ponds are capped for dust mitigation purposes, the upper sampling interval was below the cap.
- Mohawk area: a single composite sample was collected which consisted of samples from ponds PUE-01, PUE-02, PUF-01, and PUF-02 collected from surface soils.
- No-build area: three composite samples were collected which consisted of samples from ponds within the no-build area footprint. Each no-build area sample consisted of composite samples from four to five ponds each (as discussed in Table C-2) collected from surface soils.
- Sunset North area: a single composite sample was collected which consisted of samples from ponds west of the no-build area (as discussed in Table C-2) collected from surface soils. These ponds have undergone previous IRM activities.

- Spray Wheel: two composite samples were collected which consisted of samples from ponds with sediments within the Spray Wheel area. Each Spray Wheel sample consisted of composite samples from three to four ponds (as discussed in Table C-2) collected from two depths each.
- TIMET abandoned test pit: a single composite sample was collected which consisted of two samples from within the test pit footprint and from two depths each.
- Former Espey Construction site: a single composite sample was collected which consisted of two samples from within the construction site footprint and from two depths each.
- Other TIMET debris areas: a single composite sample was collected which consisted of samples from four areas identified as debris or storage areas (other than TIMET ponds, test pit or Espey Construction site). The other debris composite sample consisted of one sample from each of the four locations and from two depths each.
- TIMET berms: four composite samples were collected from berms between each of the TIMET ponds. Each sample consisted of composite samples from three locations from two depths each. Although the berms have not received any TIMET wastes, they were constructed via grading of historic BMI ponds located in this area.
- TIMET OPW ponds: two composite samples were collected which consisted of samples from each OPW pond. Each OPW pond sample consisted of composite samples from six to eight ponds each collected from two depths each. Only two samples were collected since the nature of the OPW wastes deposited in these ponds is uniform. A separate sample was collected from OPW Pond #12 since TIMET used this pond for disposal of lime bottoms. A single composite sample was collected consisting of samples from two locations within this pond and from two depths each.
- TIMET ponds: a single composite sample was collected from each of the 16 TIMET ponds. Each TIMET pond sample consisted of two composite samples from within the pond collected from two depths each. In addition, a wastewater sample was collected from Pond SW-12.
- Upper ponds: composite samples were collected, which consisted of samples from each of first seven upper pond rows from ponds with sediment (one composite sample per row). Each upper pond sample consisted of composite samples from four to six ponds each (as discussed in Table C-2) collected from two depths each.

Field sampling was conducted from July 26 through August 9, 2006. Through this effort, 53 soil samples and one sediment sample were collected for analyses, which were composited from 300 individual sample locations. A separate Data Validation Summary Report (Dataset #39) was prepared and submitted to NDEP (BRC and MWH 2006c). This report was approved by the NDEP in November 2006. This report contains

an electronic version of the waste characterization sampling database. Table C-3 summarizes the results of this investigation.

Table C-5 shows the estimated impacted soil volumes associated with the various waste areas. Figure C-4 shows the waste area locations.

3.0 RESULTS

A summary of the results of the waste sampling and analysis is provided in Table C-4. This table presents the minimum and maximum detected concentrations for each of the SRCs with a listed UTS, as defined in 40 CFR 268.48. The chemical-specific UTS times 10 and the chemicals that have been detected in concentrations that exceed 10 times their UTS are also indicated in Table C-4. Those chemicals with maximum concentrations that exceed 10 times their UTS are also compared to: 1) a potential carcinogenic direct risk from ingestion or inhalation at the site at or above 10^{-3}, and 2) a non-carcinogenic direct risk from ingestion or inhalation at the site an order of magnitude or greater over their reference dose. As discussed by USEPA (2002), hazard quotients are used as a measure of unacceptable exposure to constituents that produce toxic endpoints other than cancer.

USEPA Region 9 preliminary remediation goals (PRGs) tables provide exposure pathway-specific risk-based comparison values (USEPA 2004). These tables provide values for both carcinogenic and non-carcinogenic risks. If a particular chemical has both carcinogenic and non-carcinogenic toxicity criteria, these tables provide values for both these endpoints. Therefore, USEPA Region 9 residential PRGs for both carcinogenic and non-carcinogenic risks for the combined ingestion and inhalation exposure pathways were used in this analysis. Because PRGs for carcinogens are based on a cancer risk level of 10^{-6}, the values in the PRG tables were multiplied by 1,000 to obtain a 10^{-3} risk level. PRGs for non-carcinogens, which are based on a hazard quotient of 1, were multiplied by 10. These adjusted PRG values are shown in Table C-4 for those chemicals that exceeded 10 times their UTS. These chemicals were 2,4'-DDE, 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, beta-BHC, 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,6,7,8-HpCDF, 1,2,3,4,7,8,9-HpCDF, OCDD, and OCDF. Because PRG values were not available for 2,4'-DDE, values for 4,4'-DDE were used as a surrogate. PRG values for each of the dioxin congeners were obtained by multiplying the PRG for 2,3,7,8-TCDD by each congener's respective toxicity equivalency factor (TEF). All of the chemicals are considered carcinogens and have PRGs for carcinogenic risks. 4,4'-DDT and beta-BHC also have PRGs for non-carcinogenic risks. As indicated in Table C-4, none of these chemicals equal or exceed either a potential carcinogenic direct risk from ingestion or inhalation of 10^{-3}, nor a non-carcinogenic direct risk from ingestion or inhalation an order of magnitude or greater over their reference dose. Therefore, all of the waste materials in the Eastside met the UTS/MTR requirements.

Shaded chemicals are those with Universal Treatment Standards.
NA = not applicable; a UTS has not been established for this chemical/medium/analysis.

TABLE C-2
WASTE CHARACTERIZATION COMPOSITE SAMPLING
(Page 1 of 2)

Area / Sample ID	Spatial Composite	Depth Composite
Alpha Ditch		
WC-AD01*	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0 and 2 feet bgs
WC-AD02	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0 and 2 feet bgs
WC-AD03	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0 and 2 feet bgs
Beta Ditch		
WC-BD01	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0 , 6, and 11 feet bgs
WC-BD02	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0, 4, and 8 feet bgs
WC-BD03	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0, 4, and 8 feet bgs
IRM Soil Holding Areas		
WC-IM01	composite of 2 samples collected from IRM soil holding area in pond PUA-04	composite of samples collected from 2 and 4 feet bgs
WC-IM02	composite of 2 samples collected from IRM soil holding area in pond PUB-04	composite of samples collected from 2 and 4 feet bgs
WC-IM03	composite of 2 samples collected from IRM soil holding area in pond PUB-05	composite of samples collected from 2 and 4 feet bgs
WC-IM04	composite of 2 samples collected from IRM soil holding area in pond PUB-10	composite of samples collected from 2 and 4 feet bgs
WC-IM05	composite of 2 samples collected from IRM soil holding area in pond PUC-03	composite of samples collected from 2 and 4 feet bgs
WC-IM06	composite of 2 samples collected from IRM soil holding area in pond PUC-04	composite of samples collected from 2 and 4 feet bgs
WC-IM07	composite of 2 samples collected from IRM soil holding area in pond PUD-03	composite of samples collected from 2 and 4 feet bgs
Mohawk Area		
WC-MH01	composite of one sample each from ponds PUE-01, PUE-02, PUF-01, and PUF-02	composite of samples collected from 0 feet bgs
No-Build Area		
WC-NB01	composite of one sample each from ponds PLH-01, PLI-01, PLI-02, PLJ-01, and PLJ-02	composite of samples collected from 0 feet bgs
WC-NB02	composite of one sample each from ponds PLH-02, PLH-03, PLH-04, and PLI-03	composite of samples collected from 0 feet bgs
WC-NB03	composite of one sample each from ponds PLG-02 through PLG-05	composite of samples collected from 0 feet bgs
Sunset North Area		
WC-SN01	composite of one sample each from ponds PLD-10, PLE-08, PLE-09, PLF-05 through PLF-08, and PLG-06	composite of samples collected from 0 feet bgs
Spray Wheel		
WC-SW01	composite of one sample each from ponds PUE-08, PUE-09, PUF-08, and PUF-09	composite of samples collected from 0 and 2 feet bgs
WC-SW02	composite of one sample each from ponds PUF-07, PUG-08, and PUH-07	composite of samples collected from 0 and 2 feet bgs
Former Espey Construction Site		
WC-TE01	composite of two samples from footprint of former Espey Construction site	composite of samples collected from 0 and 2 feet bgs
Other TIMET Debris Areas		
WC-TD01	composite of one sample each from footprint of three other TIMET debris areas	composite of samples collected from 0 and 2 feet bgs
TIMET Abandoned Test Pit		
WC-TA01	composite of two samples from footprint of TIMET Abandoned Test Pit	composite of samples collected from 0 and 3 feet bgs

TABLE C-2
WASTE CHARACTERIZATION COMPOSITE SAMPLING
(Page 2 of 2)

Area / Sample ID	Spatial Composite	Depth Composite
TIMET Berms		
WC-TB01	composite of 3 equispaced samples from western berms between TIMET ponds	composite of samples collected from 0 and 2 feet bgs
WC-TB02	composite of 3 equispaced samples from central west berms between TIMET ponds	composite of samples collected from 0 and 2 feet bgs
WC-TB03	composite of 3 equispaced samples from central east berms between TIMET ponds	composite of samples collected from 0 and 2 feet bgs
WC-TB04	composite of 3 equispaced samples from eastern berms between TIMET ponds	composite of samples collected from 0 and 2 feet bgs
TIMET OPW Ponds		
WC-TW01	composite of one sample each from ponds OPW-6 through OPW-11	composite of samples collected from 0 and 3 feet bgs
WC-TW02	composite of one sample each from ponds OPW-13 through OPW-20	composite of samples collected from 0 and 3 feet bgs
WC-TW03	composite of two samples from pond OPW-12	composite of samples collected from 0 and 3 feet bgs
TIMET Ponds		
WC-TP01	composite of 2 samples from pond SC-1	composite of samples collected from 0 and 5 feet bgs
WC-TP02	composite of 2 samples from pond SW-2	composite of samples collected from 0 and 2 feet bgs
WC-TP03	composite of 2 samples from pond SW-3	composite of samples collected from 0 and 2 feet bgs
WC-TP04	composite of 2 samples from pond SW-4	composite of samples collected from 0 and 5 feet bgs
WC-TP05	composite of 2 samples from pond SW-5	composite of samples collected from 0 and 2 feet bgs
WC-TP06	composite of 2 samples from pond SW-6	composite of samples collected from 0 and 2 feet bgs
WC-TP07	composite of 2 samples from pond SW-7	composite of samples collected from 0 and 5 feet bgs
WC-TP08	composite of 2 samples from pond SW-8	composite of samples collected from 0 and 5 feet bgs
WC-TP09	composite of 2 samples from pond SW-9	composite of samples collected from 0 and 2 feet bgs
WC-TP10	composite of 2 samples from pond SW-10	composite of samples collected from 0 and 2 feet bgs
WC-TP11	composite of 2 samples from pond SW-11	composite of samples collected from 0 and 2 feet bgs
WC-TP12	composite of 2 samples from pond SW-12*	composite of samples collected from 0 and 2 feet bgs
WC-TP13	composite of 2 samples from pond HP-2	composite of samples collected from 0 and 2 feet bgs
WC-TP14	composite of 2 samples from pond HP-3	composite of samples collected from 0 and 2 feet bgs
WC-TP15	composite of 2 samples from pond HP-4	composite of samples collected from 0 and 2 feet bgs
WC-TP16	composite of 2 samples from pond HP-5	composite of samples collected from 0 and 2 feet bgs
Upper Ponds		
WC-UP01	composite of one sample each from ponds PUA-05 through PUA-10	composite of samples collected from 0 and 2 feet bgs
WC-UP02	composite of one sample each from ponds PUB-06 through PUB-09	composite of samples collected from 0 and 2 feet bgs
WC-UP03	composite of one sample each from ponds PUC-05 through PUC-08	composite of samples collected from 0 and 2 feet bgs
WC-UP04	composite of one sample each from ponds PUD-04 through PUD-09	composite of samples collected from 0 and 2 feet bgs
WC-UP05	composite of one sample each from ponds PUE-03 through PUE-07	composite of samples collected from 0 and 2 feet bgs
WC-UP06	composite of one sample each from ponds PUF-03 through PUF-06	composite of samples collected from 0 and 2 feet bgs
WC-UP07	composite of one sample each from ponds PUG-04 through PUG-07	composite of samples collected from 0 and 2 feet bgs

Note: Wastewater sample collected from TIMET Pond SW-12.

*Indicates BMI Siphon sample location.

Security Plan

Basic Remediation Company (BRC)

Corrective Action Management Unit (CAMU)

Henderson, Nevada

Table of Contents

1.0 Introduction D-1
2.0 Site Control D-1
2.1 Fencing and Gates D-1
2.2 Access D-1
2.3 Signs D-1
3.0 Communication D-1

1.0 INTRODUCTION

This Security Plan describes the procedures and barriers that will be used to prevent persons who are unaware of the danger from entering the Remedial Waste Management System (RWMS) post-closure.

2.0 SITE CONTROL

2.1 Fencing and Gates

Primary site access will be gained through the entry gate located off Warm Springs Road on the west side of the property. The entry gate will be locked to prevent unauthorized entry. The gates will remain locked except during periods of continuous ingress/egress (i.e., during solar collection field construction). Access to the site at points other than the entry gate will be discouraged by maintenance of site perimeter fencing during site operations. The Fence Plan is shown on Figure J-12 in Section 1 of the Supplemental RAP Information (SRAPI).

The monitoring program has been implemented to identify and repair breaches in the perimeter fence line within a reasonable time frame.

2.2 Access

Access to the site will be controlled by site fencing.

2.3 Signs

Bilingual Signs are posted that clearly indicate the following:

- The owner and operator of the site;
- The Site is Closed; and
- The site is private property and is not open to the public for public disposal of any waste materials whatsoever.

"No Trespassing" signs will be posted at each site entrance. Additional signs and/or measures may be required to protect personnel and public health and safety. All signs will be legible from a distance of at least 25 feet.

3.0 COMMUNICATION

Breaches in security will be reported to the BRC for immediate repair and correction. On-site communication will be through mobile phones.

Appendix A – Inspection Checklists

1.0 INTRODUCTION

This Inspection Plan describes the items, areas, units, and equipment that were inspected during the construction and operation of the BRC CAMU to identify malfunctions, deterioration, operator errors, and discharges that may have caused, or may led to, a release of waste constituents to the environment or a threat to human health. Inspections performed during the post-closure care period are discussed in Attachment O. This plan includes checklists, schedules, and qualifications of personnel charged to perform inspections. Proposed Construction Quality Assurance-related inspections are described in the Supplement RAP Information (SRAPI) Sections 3 and 6 for the liner and cover, respectively. The Final CQA Plan implemented at the Site is included as SRAPI Section 10.

BRC, or their designate, inspected monitoring equipment, safety and emergency equipment, security devices, and operating and structural equipment (such as dikes and sump pumps) which were important to preventing, detecting, or responding to environmental or human health hazards. Inspection checklists were kept on site and identified the types of problems (e.g., malfunctions or deterioration) which were looked for during the inspection (e.g., inoperative sump pump, leaking fitting, erosion, etc.). Example inspection checklists are included as Appendix A.

1.1 Personnel

To develop and maintain the overall BRC CAMU in conformance with the inspection standards outlined in this document, BRC employees and/or contractors were assigned to site inspections. Other employees or contractors were assigned, as needed, for support activities.

The following is a list of assigned personnel with a brief outline of their qualifications:

- Weston Solutions, Inc (Weston)–Weston was the Construction Manager for the project. They maintained an office near the site. Weston was directly responsible for all site-related inspection activities. Weston assigned inspection duties, ensured all activities were performed on schedule, and maintain records in accordance with this plan and the Reports and Recordkeeping Plan (Attachment T). Weston reported to the Project Manager, BRC.

- ENTACT (General Contractor/Subcontractors)– The Contractor possessed experience and training in the fields of heavy equipment operation, earth movement, site and roadway construction, maintenance, and cleanup. The primary inspection responsibilities for ENTACT included equipment and

additional inspections as directed by the Construction Manager including daily policing of the site perimeter and regulation of site access, providing directions to disposal locations, monitoring received waste and collecting management data. ENTACT reported to the Construction Manager.

BRC placed and maintained individuals with the overall training, experience, capabilities, and/or other qualifications in the above noted positions as necessary to operate and develop the site in such a manner as to meet or exceed applicable requirements and regulations. Additional equipment and personnel was provided as required to accomplish overall site maintenance and operation standards, which equal or exceed all applicable State and local rules and regulations pertaining to site safety measures and the overall general protection of the area's environment.

2.0 OPERATIONAL INSPECTIONS

2.1 Health and Safety

Health and Safety inspections were performed as outlined in the Construction Accident Prevention, Contingency, and Emergency Response Plan (Attachment G in the Updated RAP, 2015 included as Attachment W). These inspections were carried out by ENTACT. The Health and Safety inspections included verifying Personal Protective Equipment (PPE) and communication devices were in good, working condition, inspection of safe work practices, and verifying personnel had received proper health and safety training. If conditions were found to be unsafe through inspections, ENTACT halted work and addressed problems. Examples of unsafe conditions are: PPE or radio/communication malfunction, severe weather, and/or fire.

2.2 Air Monitoring

Air monitoring was initially performed at the CAMU and was performed continuously during Slit Trench excavation. Results of air monitoring did not indicate any exceedances of constituents at the property boundary. Dust suppression activities were implemented during construction and closure.

2.3 Hauling/Transport

Haul routes were inspected on a daily basis by ENTACT during hauling operations. Condition of the haul routes were evaluated daily to determine if repairs were required. Repairs were made when rutting, drainage, or other issues impacted the transport of the waste materials.

Hauling/transport equipment were kept in good working order and had covers over the load. Standard construction entrance features (rumble strips and large aggregate aprons) were used to remove soil from vehicle wheels departing the BRC CAMU site. Sweeper and vacuum trucks were used daily to maintain haul routes.

2.4 Surface Water

During construction activities ENTACT was responsible for inspecting the storm water collection system after precipitation events (i.e. post storm) exceeding 1/4 inch in a 24 hour period and evaluated erosion, sedimentation, and other damage, if any. BRC performed inspections when ENTACT was not onsite. In addition, the post storm inspection was performed to evaluate the potential for surface water infiltration into the BRC CAMU. Surface water conveyance features were inspected quarterly during the dry season and weekly during the wet season for sediment and debris accumulation. Collection and holding facilities were inspected for sediment build-up and debris after precipitation events (i.e. post storm) exceeding 1/4 inch in a 24 hour period to maintain conveyance and design capacity.

Accumulated surface water, which had not entered the waste containing areas of the BRC CAMU, were removed as soon as practical. An operational pump and appurtenant equipment was maintained on-site during the entirety of the project (and not just during typically wet periods of the year) for use in surface water removal. Accumulated surface water, which had contacted the waste material, was treated as leachate and used as dust control over waste areas.

2.5 Leachate

Leachate monitoring during operation and closure was conducted in accordance with the Final Leachate Monitoring Plan (Attachment Z-1).

During operation and closure, leachate was handled for proper disposal in accordance with BRC CAMU Operation Plan (Attachment M) and the Leachate Management Plan (Attachment Z-1).

During the post-closure period, leachate will be monitored and managed in accordance with the Post-Closure Leachate Management Plan (Attachment Z-2)

2.6 Gates and Fences

ENTACT inspected the fences and gates routinely to ensure all were in proper working order. If ENTACT was not onsite, BRC performed the inspections. In addition, the security guard noted any missing or damaged signs around the property as well as

evidence of unauthorized access. Damages were recorded and repairs performed immediately to minimize unauthorized site access.

2.7 Liner and Cover Systems

During construction and installation, liners and cover systems were inspected regularly for uniformity, damage, and imperfections (e.g., holes, cracks, thin spots, or foreign materials) as outlined in the CQA Plan (SRAPI, Section 10). The liner system was inspected weekly during waste placement activities to verify the system remained undamaged. If damage occurred, work activities in the area of the damage were halted while damage was repaired.

2.8 Equipment

During construction activities, all equipment in operation was inspected daily by the equipment operator. ENTACT also inspected and tracked on-site equipment to ensure that it was in good working order. Inspections were performed by equipment operators to ensure equipment was in good working order. Equipment which was not in good working order was not used until repaired or replaced.

2.9 Best Management Practices

Best management practices (BMPs) were inspected weekly and after storm events to verify they were in good, working condition. If inspections indicated BMPs were damaged, they were replaced.

3.0 RECORDKEEPING

BRC or their designee (Weston or ENTACT) recorded inspections in an inspection log. These records will be kept in accordance with the records retention requirements of the AOC3. At a minimum, these records included the date and time of the inspection, the name of the inspector, a notation of the observations made, and the date and nature of any repairs or other remedial actions. Example inspection checklists are included as Appendix A.

Appendix C – Organizational Flowchart

1.0 INTRODUCTION

This Personnel Training Plan describes the personnel and classroom or on-the-job training workers and other site personnel receive on how to perform their duties in a way that ensures the BRC CAMU complies with the conditions of this Updated RAP and how to respond effectively to emergencies.

1.1 Personnel

To develop and maintain the overall BRC CAMU in conformance with the design and operational standards outlined in this document, one employee will be assigned to oversee post-closure maintenance and monitoring activities. Other employees or contractors will be assigned, as needed, for support activities.

The following is a list of on-site personnel with a brief outline of their qualifications:

- BRC CAMU Facility Manager – The BRC CAMU Manager will be on-site as needed to oversee post-closure maintenance and monitoring activities. The BRC CAMU Facility Manager will be:

  Josh Carroll
  875 West Warm Springs Road
  Henderson, Nevada 89015
  (702) 568-2891

- Post-Closure Care Personnel – Post-Closure Care personnel will be onsite periodically throughout the year to perform groundwater monitoring, site inspections, repairs, and pump maintenance. These personnel will report to the BRC CAMU Facility Manager.

2.0 TRAINING

BRC is committed to placing and maintaining individuals with such overall training, experience, capabilities, and/or other qualifications in the above noted positions as necessary to monitor and maintain the site in such a manner as to meet or exceed applicable requirements and regulations. Additional equipment and personnel will be provided as required to accomplish overall site maintenance standards, which equal or exceed all applicable State and local rules and regulations pertaining to site safety measures, and the overall general protection of the area's environment.

2.1 Post-Closure Personnel Training

Post-closure care personnel will have received adequate training in their specific job duties. This includes Occupational Safety and Health Administration (OSHA) 24-hour Hazardous Waste Operations and Emergency Response (HAZWOPER) health-and-safety training as well as pertinent training in BRC CAMU maintenance procedures. Post-closure care personnel managing leachate shall have 40-hour OSHA HAZWOPER training. Personnel shall have training up-to-date with annual 8-hour refresher training. In addition, staff will be trained on emergency procedures and contacts as well as hazards they may encounter at the BRC CAMU. This post-closure staff will consist of a facility manager and various staff workers as needed. The name, address, and telephone number of the facility manager will be provided to the NDEP during the closure process.

3.0 RECORDKEEPING

BRC will maintain the following documents and records for Post-Closure Care position at the facility:

- The job title for each position
- The name of the employee filling each position
- Duties of employees assigned
- Description of training
- Records documenting completion of training

BRC will maintain records at their onsite facilities. All records will be kept in accordance with the record retention requirements of the AOC3.

Appendix A
Training Course Descriptions

HAZWOPER 40 Hour Course

OSHACAMPUS.com™
powered by 360training

Course Description

This course covers broad issues pertaining to the hazard recognition at work sites. OSHA has developed the HAZWOPER program to protect the workers working at hazardous sites and devised extensive regulations to ensure their safety and health. This course, while identifying different types of hazards, also suggests possible precautions and protective measures to reduce or eliminate hazards at the work place. It is specifically designed for workers who are involved in clean-up operations, voluntary clean-up operations, emergency response operations, and storage, disposal, or treatment of hazardous substances or uncontrolled hazardous waste sites. Topics include: protection against hazardous chemicals, elimination of hazardous chemicals, safety of workers and the environment, and OSHA regulations. This course covers topics included in 29 CFR 1910.120.

Regulatory

This course meets the in class training requirements of the 1910.120 standard. An additional 8 hours of hands on training is required to meet the training requirements of the standard.

Seat Time

This course has been approved for 40 hours.

Course Pre-Requisite

There are no pre-requisite requirements for this course. Upon successful completion of this course, you will be able to print your certificate.

Testing:

Quizzes: Lesson quizzes require no mastery. Quizzes at the end of each module require a passing grade to proceed to the next module. Final Exam: Final Exam must be passed with a 70% to pass the course. The final exam can be taken three times if necessary.

Topics Covered

- Regulation Overview
- Site Characterization
- Toxicology
- Hazard Recognition
- Hazard & Safety Analysis
- Hazardous Chemical Awareness
- Radiological Hazards
- Respiratory Protection
- Personal Protective Equipment
- Site Control
- Decontamination
- Medical Surveillance
- Air Monitoring
- Confined Space Entry
- Emergency Procedures
- Material Sampling

HAZWOPER 8 Hour Annual Refresher Course

OSHACAMPUS.com™
powered by 360training

Course Description

This course meets the requirements in OSHA 29 CFR 1910.120 for 8 hours of annual refresher training for workers at hazardous waste sites. This course is designed for general site workers who remove hazardous waste or who are exposed or potentially exposed to hazardous substances or health hazards. Topics include HAZWOPER regulations, safety and health plans, hazardous chemicals, safety hazards, air monitoring, medical surveillance, site control, decontamination, personal protective equipment, and respiratory equipment. This course covers the topics in OSHA 29 CFR 1910.120

Learning Objectives

- Read and understand OSHA regulations and requirements
- Use Site Characterization to identify hazards found in the workplace and steps to be taken to minimize hazards
- Understand the principles of toxicology and how they relate to various types of chemical exposures
- Develop a Medical Surveillance Program and understand its purpose
- Identify the uses for Personal Protective Equipment (PPE) and how to choose the correct PPE for a situation
- Understand the principles of decontamination as well as levels of decontamination and decontamination methods
- Have a better understanding of potentially hazardous situations involving corrosives, solvents, oxidizers, and reactive chemicals
- Understand the various considerations in an emergency and the importance of training and actions to personal safety and the safety of others

Topics Covered

- Regulation Overview
- Hazard Recognition
- Site Characterization, Analysis, and Control
- Toxicology
- Medical Surveillance
- Safe Work Practices and PPE
- Decontamination
- Chemical Awareness
- Emergency Procedures

Regulatory

Please refer to the state/regulatory requirement in the course catalog page.

Seat Time

This course has been approved for 8 hours

Course Pre-Requisite

Must have taken the 24 or 40 hour HAZWOPER course

Testing

Quizzes: All quizzes must be passed with a 100% to proceed to the next lesson. Final Exam: Final exam must be passed with a 70% to pass the next course. The final exam can be taken three times if necessary.

Standard First Aid with CPR/AED - Adult
American Red Cross First Aid with CPR/AED - Adult, trains participants to recognized ad care for life-threatening respiratory or cardiac emergencies in adults and provides the knowledge and skills needed to care for injury or sudden illness until professional medical help arrives. Training complements adult learning styles with hands-on practice and real-life scenarios while take-away materials serve as excellent refresher tools after training is complete. This comprehensive course meets training guidelines for first aid programs established by the Occupational Safety and Health Administration.
Topics covered include:
Recognizing and respond to an emergency.
How to care for a person who is choking.
Checking an unconscious person for life-threatening and nonlife-threatening conditions.
Recognizing and caring for a person who is not breathing.
How to care for a heart attack and how to give CPR.
Using and AED and identifying precautions when using and AED.
Identifying the signs and symptoms of sudden illness, including stroke, diabetic emergency, poisoning and allergic reactions and care for them.
Controlling bleeding.
Recognizing and caring for heat- and cold-related emergencies.

BCF Welder Training

Course Description

Socket Fusion Training This four-hour course covers all aspects of hand-held and machine Socket Fusion Technology. Trainees will demonstrate their ability to perform socket fusion joining.	**Standard Butt Fusion Training (Conventional or CNC)** This four-hour course covers all aspects of Standard Butt Fusion Technology. Trainees will demonstrate

Upon successful completion and testing, the trainee will receive a Certificate of Completion and an Installer's Badge which may be worn on the job site.	their ability to prepare pipe, face pipe, heat and join piping.
IR Level I Welder Training This course covers fundamental training absolutely necessary for proper operation of the infrared (IR Plus) fusion machines. Topics: • Plastic pipe fundamentals • Infrared butt fusion • General information • Design/function/operation of the IR Plus fusion machines • Weld bead inspection • Basic machine maintenance Duration/Value: • 1 day/$250.00 per person Register now	**IR Level II Maintenance Training** Completion of this 16-hour (2 day) class allows the trainee to maintain external parts of the machine. Prerequisite: • All attendees must have completed the Georg Fischer IR Level I Welder Certification Program and Weld Inspection Program Topics: • Technical concepts of the machine • Machine inspections • Functional check • Maintenance procedures Level II • Alignment and adjustments • Weld evaluation • Documentation Duration/Value: • 2 days/$500.00 per person Register now
IR Level III Maintenance Training **(Authorization Required)** Completion of this 32-hour (4 day) class allows the trainee to maintain external and internal parts of the machine. This course is conducted at the Georg Fischer Tustin facility only. Prerequisite: • All attendees must have completed the Georg Fischer IR Level II Maintenance Training Topics: • Technical concepts of the machine • Machine inspections • Functional check • Maintenance procedures Level III • Alignment and adjustments • Weld Inspection Program • Documentation Duration/Value: • 4 days/$1,500.00 per person Register now	**IR Level III Refresher Training** **(Authorization Required)** This course is a refresher for Level III personnel and includes current updates for the IR 63, IR 225, and IR Plus machines. This course must be taken 1 year after the initial Level III course and then every two years after that. This course is condcuted at the Georg Fischer Tustin facility only. Prerequisite: • All attendees must have completed the Georg Fischer IR Welder Certification and IR Level II and Level III Maintenance Training. Duration/Value: • 2 days/$500.00 per person Register now
IR Weld Inspection Program (WIP) Upon completion of this eight-hour (1 day) class, the QU inspector will have a good basis to perform on-site visual IR weld evaluation. Topics: • Weld background • Terminology • Bead characteristics • Restmelt evaluation • Flow charts and checklist Duration/Value:	**BCF Welder Training** This four-hour course covers all aspects of using the BCF Flow Fusion Technology. Trainee will prepare pipe samples, insert and remove bladders, generate welds, and perform hot cleaning of the heater heads. Upon successful completion and testing, the trainee will receive a Certificate of Completion and an Installer's Badge which may be worn on the job site. Prerequisite: • All attendees must have completed the Georg Fischer IR Level I Welder Training

- 1 day/$250.00 per person

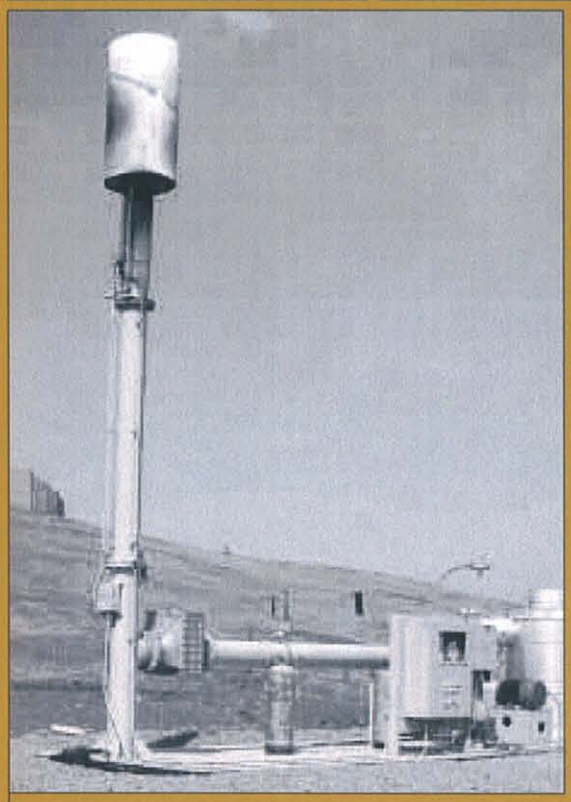
2007 TRAINING COURSE CATALOG

SWANA®

SOLID WASTE ASSOCIATION of North America

THE LEADING PROFESSIONAL ASSOCIATION IN THE SOLID WASTE FIELD



I AM**SWANA**

"Many people overlook the hard work and dedication necessary to perform a public service like solid waste management. SWANA's training courses make it possible for these men and women to operate at the highest level of performance with a sense of pride and achievement."

Bill Tobin | Director of Field Operations
Waste Authority of Montgomery County

Message from SWANA's President

INTRODUCTORY LETTER FROM TOM PARKER

Dear Colleague,

Thank you for choosing SWANA as the provider of all your training and professional development needs. For over 40 years, SWANA has thrived at the forefront of all training and education for municipal solid waste needs. This effort results from our first-and-foremost commitment to you, our members, but also to the field of solid waste.

The 2007 catalog contains training opportunities for you and all your staff. Whether you need training for professional development, for SWANA certification, or to maintain a current certification, SWANA offers specific education to fit your needs. This year SWANA Training takes place as several great locations beginning in Tampa, Fla., and closing out the year at WASTECON 2007 in Reno, Nev.

SWANA gives you what you need to stay ahead of them game with our new list of course offerings. We have updated the Manager of Landfill Operations Course (MOLO) and our ever-growing line of distance learning opportunities. With our increased offerings of E-Courses and E-Sessions, you can train individually at your desk or with your whole staff in a conference room to get the most out of your money! As with all SWANA events, in person and online, you will interact with and learn from some of the best and the brightest in the industry.

Thank you for your continued support of SWANA, and our mission to advance the practice of economically and environmentally sound management of municipal solid waste. I look forward to learning from you online or at one of our live events.

Sincerely,

Tom Parker, P.E
CDM, New Mexico
SWANA President

P.S. Receive the mark of professionalism in the solid waste industry with SWANA certification. SWANA offers eight different Certifications including the industry's only Bioreactor Landfill Certification. In this competitive landscape, it is integral to have an integrated MSW management background to efficiently manage your facility.

About the SWANA Training Catalog

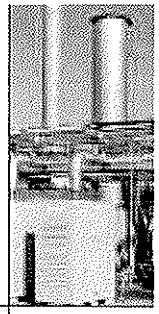
Congratulations on choosing SWANA for your professional development, training and certification!

For those of you who are new to SWANA: Welcome. To our over 7,700 loyal members, thank you for your continued support of SWANA's Technical Programs, and welcome to our new catalog format. Our new look has been designed to showcase SWANA's commitment to providing the best-in-class educational products to the entire solid waste industry. Today, SWANA continues that pledge with more educational products than ever before.

We hope the new format will make it easier for you to find just what you are looking for by using the following symbols to indicate the format of each product. Additional information including full course descriptions, is available on **www.SWANA.org** under "Educate".

- **SWANA Classroom Training:** Held at SWANA events throughout the year.
- **SWANA Chapter Partnering Events:** SWANA Chapters host additional SWANA training courses throughout North America.
- **E-Courses:** Traditional courses and brand new offerings that can be accessed from the convenience of your office. E-Courses are conducted through SWANA's web conferencing and teleconferencing system.
- **E-Sessions:** The best of SWANA's technical sessions brought to you each month through Web conferencing. These 75-minute sessions give you and your staff an opportunity to learn from the experts in this extended session. A different topic is covered every month.
- **E-Studies:** These self-paced, self-study options give you the training and the CEUs you need. All it takes is an internet browser.
- **On-Site Training:** Full training packages that you deliver to your staff at your own site and at your own pace.
- **Home Study Courses:** Written materials on important solid waste topics. Looking for CEUs – just pass the test that comes with the course and you'll qualify.
- **SWANA Training On Demand:** Do you have a group that needs to be trained and the next event isn't soon enough or your budget can't afford the cost? Let our best-in-class training come to you! Any of our courses can be customized to your needs. For quotes, contact **learn@SWANA.org**.

We love to hear about the training and educational products that you need. You can always reach us with your ideas, comments and feedback at **learn@SWANA.org**.



Getting SWANA Certified Easy As 1, 2, 3!

SWANA's Certification Training Courses

1. CHOOSE YOUR DISCIPLINE(S).

The Solid Waste Association of North America offers eight (8) certifications in the following solid waste disciplines:

- Landfill Management (MOLO)
- Bioreactor Landfill*
- Collections Systems
- Composting Programs
- Construction & Demolition Materials (C&D)
- Principles of MSW Management
- Recycling Systems
- Transfer Station Systems

* The Bioreactor Landfill certification requires candidates to hold a current SWANA Landfill management certification.

2. CHOOSE YOUR CERTIFICATION LEVEL.

Most SWANA Certifications offer at least two (2) eligibility levels, with an additional Inspector level offered to Landfill and Construction & Demolition SWANA Certification holders:

- **Technical Associate:** This level is ideal for professionals new to the industry and involved in the planning, design, implementation, operation or promotion of the MSW field. This would also include consultants, planners, vendors and regulators, etc. A minimum of a High School Degree or GED Required.
- **Manager:** This professional must meet all of the requirements of the Technical Associate level plus a minimum of five (5) years** experience in Municipal Solid Waste Management. Also required are at least two (2) years experience in a management/supervisory position*** in the discipline for which you are applying.

** 4-year degree in a related field may be substituted for up to 2 years of MSW experience
*** directly responsible for daily operations; compliance with design and permit conditions, utilization of field equipment and services, personnel needs, utilization and retention.

- **Inspector:** Unique to Landfill and Construction & Demolition certification holders, this professional must meet all of the requirements of the Technical Associate level as well as the ability to issue official citations for violations which require action/impose penalties. This professional must also be an active inspector with at least 2 years experience.

3. PASS THE SWANA CERTIFICATION EXAM FOR YOUR DISCIPLINE.

SWANA certification exams are offered at all SWANA and SWANA Chapter training events, even if the preparatory class is not being offered. You may only sit for one exam per testing session. You are not required to attend the preparatory training courses to become certified; however, it does reinforce your knowledge in a particular discipline. A passing score of 70% or above is needed to become SWANA certified. You will be allotted three (3) hours to complete your exam. All exams are proctored.

You may use calculators, preferably one capable of handling up to seven digits. Landfill Certification candidates may use MOLO scales for maps. The exam is a "closed book" exam so you may not bring manuals, worksheet or notes to the testing site. Before leaving the testing site, you will be asked to complete the SWANA Certification Application. Exam results will be mailed to the certification candidates within 60 days of the test date.

If you have any questions about becoming SWANA Certified, please contact us at **cert@SWANA.org**.

SWANA[DL] (Distance Learning)

SWANA CEUs are available for most SWANA Courses

Can't get away from work? Enjoy the industry's top training from the comfort of your home or office with SWANA[DL] (Distance Learning). With these courses, get the training you need in a format you want. SWANA[DL] allows you to train from your home or office, with your computer, or with home study manuals. Also by attending these courses, Certified Professionals can earn SWANA Continuing Education Units (CEUs). With SWANA[DL], training has never been easier!

E-COURSES

Learn, Earn and Return with these new online courses! You'll learn about a wide range of solid waste topics. Every course is taught by SWANA faculty. All you need is an internet connection and separate phone line and you're ready to learn. Each session lasts up to two hours, making SWANA training more convenient than ever! For a schedule of upcoming E-Courses, visit **www.SWANAstore.com** and click on E-Courses.

E-SESSIONS

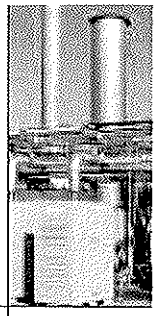
With these 75-minute presentations you can attend SWANA technical sessions all year long, from any location! These sessions bring you the latest on today's hot topics on the first three Wednesdays of the month. Each month focuses on a different area of MSW to keep you informed on all the current trends in solid waste. For a schedule of upcoming E-Session topics visit **www.SWANAstore.com** and click on E-Sessions.

E-STUDIES

Train your way with these self-paced online courses. These courses are completely online and are always a click away. The course also moves with you, so you spend your time on the areas that you need. Many of our courses also allow more than one user to train per account, with our new subscription-based pricing plan. Training has never been more flexible than it is with these courses!

Courses include:

- Landfill Operations
- Composting Operations
- Transfer Station Health and Safety
- Waste Screening
- Landfill Health and Safety
- Landfill Gas Primer
- Establishing An Electronics Recycling Program
- Integrated Solid Waste Management



SWANA[DL] (Distance Learning)

HOME STUDY COURSES ✉

Not quite ready for the world of online learning but still need convenient training? Well then look no further than SWANA Home Study Courses. Each course includes a manual that you review at your own pace. Once you're comfortable with the information, complete the enclosed exam. Score a 90% or better and you'll receive credit for the course. The manual also serves as a good reference once you've completed the course.

Courses include:

- Managing Landfill Gas at MSW Landfills
- Waste Screening at MSW Management Facilities
- Groundwater Monitoring, Sampling, Analysis & Construction
- Leachate Generation, Collection & Treatment at MSW Landfills
- Construction Waste and Demolition Debris Materials Manual

ON-SITE COURSES

Act as a trainer for your staff with these courses. Each course contains 8-10 hours of training, made up of smaller modules. This allows the courses to be tailor-made for your company.

Courses include:

- Training for Sanitary Landfill Operations Personnel
- Training for Collection Operations Personnel
- Waste Screening at MSW Management Facilities
- Health and Safety for MSW Landfill Training
- Health and Safety for MRF Personnel
- Health and Safety for Collection Personnel
- Health and Safety for Transfer Station Personnel

TRAIN YOUR WHOLE STAFF WITH SWANA E-TRAINING AND SAVE BIG!

When signing up for an E-Course or E-Sessions you register for one computer. By hooking up a projector and speaker phone, you could present E-Training to your whole staff for the cost of one registration, saving you big on training!

SWANA CEUs will only be allocated for registered individuals.

SWANA E-Training Calendar of Events

SWANA's E-Training allows you to receive the industry's best training from the comfort of your home or office. The Web seminars are the perfect way for busy professionals to stay current on the latest trends in the industry. These courses are always being updated in a continuing effort to bring you fresh, new training. The listing below is just a taste of what's to come. Keep an eye on **www.SWANAstore.com** for all the latest developments in SWANA's E-Training.

Have you attended a local training or technical session that you think all solid waste professionals could benefit from? Let us know! SWANA is always looking for ways to promote training that today's solid waste professionals can use. E-mail **learn@SWANA.org** with any topics or suggestions, as well as at which event the training was presented.

SWANA Technical Divisions

SWANA's Premier Training Courses

Join one of SWANA's Technical Divisions and shape the future of solid waste management.

The Benefits include

- Access to cutting-edge information
  - TECHnews—electronic newsletter with the latest news in your specific field
  - SWANA's online eLibrary and Members Only section including the Division subscriber list
- Unmatched networking opportunities
  - Participate in an exchange of ideas with more than 2,700 Division Members
  - Receive a contact list of all Technical Division Subscribers
  - Make valuable contacts at conferences
  - Post and respond to questions through an electronic Technical Division Members list serve
- Shape the future of SWANA
  - Help develop programs for symposia
  - Guide technical policies and advocacy initiatives
  - Produce real change on industry issues
- Special discounts
  - $25 registration discount to your Division's annual symposium
  - Special discounts on publications, conference proceedings and training, and online educational sessions and events

MANAGER OF LANDFILL OPERATIONS (MOLO)

3-Day Certification Prep Course

Updated for 2007

Updated for 2007 for the Landfill Certification contains all the latest landfill techniques and technologies to keep you ahead of the competition. Learn to efficiently run your landfill, as well as gain knowledge on planning, operating and closing a landfill. Discuss issues surrounding regulatory standards, compliance with design requirements, and an introduction to state-of-the-art bioreactor landfill technologies. Upon completion of the course you will gain a better understanding of landfill economics, leachate and landfill gas management, and comprehend the importance of safety and contingency counter measures.

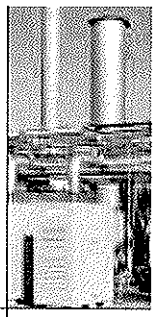
Need some help preparing for the MOLO, try these:

MOLO: JUST THE MATH E-COURSE

Planning to take the MOLO exam, but need to brush up on the math? With this live web course you can prepare for the math that is covered on the MOLO exam from your home or office. All you need is an internet connection and separate phone line and you're ready to learn the math. Taught by MOLO faculty, this course covers such calculations as elevation, area, slope, and volume. And because the course is only two hours long, you can learn and return to work. **MOLO: Just the Math does not allocate CEUs toward SWANA recertification.**

LANDFILL OPERATIONS

Need a boost to get ready for the MOLO or just need a refresher before taking the SWANA Landfill Certification Exam? Then get online with this new E-Study Course. Learn about such topics as Waste Decomposition, Geology and Hydrology, Landfill Design and Construction, General Operations, and Regulations from your computer. The course has also been enhanced with up-to-date photographs, audio, interactive exercises, related online links, and video to make learning more enjoyable.



Landfill and Landfill Gas Courses

SWANA's Premier Training Courses

THE WORLD'S ONLY BIOREACTOR LANDFILL CERTIFICATION PROGRAM

Technology is changing and bioreactor landfills are emerging. Now it is your turn to learn what bioreactors can do for you. Get career-enhancing certification by taking this prep course for the Bioreactor Landfill Certification exam. Examine the unique characteristics of a bioreactor landfill in comparison with dry tomb landfills in this brand new course. Explore the methods of introducing air and water into landfill cells, while at the same time discovering how this cutting-edge technology can increase landfill gas activity.

Special Publication: *Manager of Bioreactor Landfill Operations Body Of Knowledge*

The SWANA Manager of Bioreactor Landfill Operations Body Of Knowledge (BOK) is a compendium of the basic knowledge an individual must know to accomplish the work of a Manager of Bioreactor Landfill Operations. This BOK includes both proven traditional practices and the innovative, advanced practices of managing a bioreactor landfill, as well as empirical, esthetical, ethical and tacit knowledge. The Manager of Bioreactor Landfill Operations BOK is the basis of the SWANA Bioreactor Landfill course and certification exam.

The BOK consists of eight comprehensive knowledge statements covering the knowledge and abilities a manager of bioreactor landfills should have in the areas of construction, operation and monitoring of bioreactor landfills. You can use the BOK to prepare for the SWANA certification exam or as a tool for your operations.

Go to **www.SWANAstore.com** to order.

Landfill and Landfill Gas Courses

For SWANA CEU information, see pages 27-28.

LANDFILL OPERATIONAL ISSUES

2-Day Course/ 1-Day Workshop

This course is perfect for anyone interested in learning more about improving the daily operations at their landfill site. You will experience in-depth discussions that will help you solve everyday issues surrounding landfill operations and be able to understand successful landfill management practices, including equipment selection. Turn your landfill into a money maker by learning how to control cost, maximize your site's airspace, and determine if your landfill is really efficient. Upon completion of the course, you can earn valuable SWANA Continuing Education Units (CEUs). Furthermore, with your registration you will receive the book *The Handbook of Landfill Operations,* by Neal Bolton, P.E.

HEALTH AND SAFETY FOR MSW LANDFILL OPERATIONS PERSONNEL

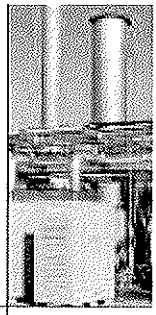
1-Day Course

Discover new horizons by enhancing your landfill health and safety program! This course prepares you to easily and intelligently identify and circumvent landfill health and safety issues. Not only will you learn exactly what elements constitute a proper loss control program, but you will understand the importance of establishing an effective program and overview OSHA and federal regulations. At the end of this course, participants will be able to recognize an unsafe practice and know how to handle it. Not only will you earn valuable SWANA Continuing Education Units (CEUs), but you will also gain imperative knowledge on how to keep your landfill safe.

LANDFILL GAS BASICS

1-Day Course

Don't waste landfill gas! Learn to "Control, Manage and Capture" it! These are the key concepts to successfully understanding landfill gas basics. Through exercises and case studies, SWANA instructors will help you grasp these three ideas in this introductory course. You will gain vital insight about gas regulations and become familiar with system design, construction and monitoring. In addition, you will be provided with information and guidance in order to understand the importance of landfill gas utilization. Anyone working with a landfill gas system will benefit from this course.



Landfill and Landfill Gas Courses

LANDFILL GAS SYSTEM OPERATION

2-Day Course and 1-Day Workshop

Go "beyond basics" with this interactive workshop exploring the daily challenges associated with operations and maintenance of LFG systems. Share knowledge with your colleagues and learn new approaches for capturing, controlling, and managing landfill gas. This interactive session will be moderated by a SWANA faculty member, and is a great way to actively increase your knowledge of landfill gas systems.

TRAINING FOR SANITARY LANDFILL OPERATIONS PERSONNEL

1-Day Course

Through interactive classroom exercises, discussions and case studies, you will overview landfill operations and how they relate to one another in order to learn how to be more effective on the job. Instructors with in-depth experience in landfill operations will help you gain a better understanding of the fundamentals of groundwater movement, accident analysis and recognize the factors that contribute to leachate production. In addition, receive top of the line training on how sanitary landfills work as components of integrated solid waste management systems.

LANDFILL GAS PRIMER

Gain vital insight about gas regulations and become familiar with system design, construction and monitoring. In addition, you will be provided with information and guidance in order to understand the importance of landfill gas utilization. Anyone working with a landfill gas system will benefit from this course. As with all online E-Study Courses, you determine the pace and schedule of the course.

ECTC PRESENTS CONTROLLING EROSION & STORM WATER RUNOFF ON LANDFILL CAPS

Finish your landfill off with style with this new E-Course. In a partnership with the Erosion Control Technology Council (ECTC), SWANA is proud to present this new E-Course to help landfill owners create more presentable landfill caps through the use of Rolled Erosion Control Products (RECPs). Presented by a member of ECTC, this course will cover such topics as NPDES Regulations, an overview of RECPs, as well as the installation, design, and selection of RECPs.

Landfill and Landfill Gas Courses

For SWANA CEU information, see pages 27-28.

CONSTRUCTION WASTE & DEMOLITION DEBRIS RECYCLING... A PRIMER

An educational tool for communities and private sector interests, this document focuses on the planning issues and implementation opportunities associated with the recycling of construction waste and demolition debris. Lessons covered include regulatory climate, generation data, materials, market opportunities, and management systems to name a few. Keep the manual for future reference, so you'll always have this valuable information at your fingertips.

MANAGING LANDFILL GAS AT MUNICIPAL SOLID WASTE LANDFILLS

This course is perfect for those seeking guidance on the complex issue of landfill gas management. This course covers such topics as MSW landfill emission generation, composition, migrations and extraction components, as well as regulatory codes pertaining to RCRA and the Clean Air Act. As with all Home Study Courses, keep the manual for future reference!

LITTER MANAGEMENT AT MSW LANDFILLS

Are you blown away by the cost of litter at your landfill? Let SWANA help you clean up your act with Litter Management at MSW Landfills. Learn about the impact of litter and the importance of a good litter management program, as well as the sources and causes of litter. Learn about litter control techniques from one of the industry's top professionals from the comfort of your home or office.

LEACHATE GENERATION, COLLECTION AND TREATMENT AT MSW LANDFILLS

Learn about the common constituents that make up groundwater and biological treatment. Also get an understanding of the regulatory scope of RCRA Subtitle D in regards to groundwater monitoring, and become familiar with leachate recirculation methods. Keep the manual for future reference, so you'll always have this valuable information at your fingertips.

GROUNDWATER MONITORING, SAMPLING, ANALYSIS AND WELL CONSTRUCTION

This course provides MSW professionals with an understanding of monitoring groundwater within the scope of RCRA Subtitle D. Topics include design and construction of wells, monitoring programs, and corrective actions. As with all Home Study Courses, keep the manual for future reference!

Collection and Transfer Courses

For SWANA CEU information, see pages 27-28.

MANAGING TRANSFER STATION SYSTEMS

3-Day Certification Prep Course

Be a lean mean, transfer operations machine! As a prep course for the Transfer Systems Certification exam, anyone who is or would like to become a transfer station manager or consulting engineer will be provided with fundamental information on ways to effectively plan, design, and operate MSW transfer stations. Receive cutting edge training on how to run a MSW transfer station in the most successful way by experiencing a hands-on tour, a field exercise at a local transfer station facility and classroom taught exercises. In addition, learn about design objectives including capacity, selection of appropriate technology, structure considerations and site planning.

MANAGING MUNICIPAL SOLID WASTE COLLECTION SYSTEMS

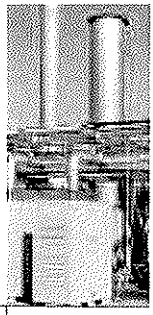
3-Day Certification Prep Course

Be able to handle waste with haste through this prep course for the Collection Systems Certification exam. Receive instruction in all the areas tested on the exam, such as an understanding of the logistics of planning, managing and operating solid waste and recyclables collection services. This course consists of presentations, classroom exercises and case studies that will enable you to navigate and chart routes more effectively. You will examine waste characteristics, service types, equipment, routing and system design. Furthermore, learn up-to-date practices for handling various materials, including residential MSW, traditional recyclables, yard wastes, bulky items and commercial wastes.

TRAINING FOR COLLECTION OPERATIONS PERSONNEL

1-Day Course

Save time and money on every route, every day! Individuals who are responsible for the collection of solid waste and recyclables from household and commercial establishments on a day-to-day basis can increase their knowledge of collection strategies. Be provided with what every collection operations personnel should know through interactive classroom exercises, discussions and case studies. Time is money, and this course will help you to acquire a higher understanding of routing in order to be cost-efficient. Furthermore, learn how to define a preventative maintenance program, go over the importance of effective sanitation practices, and obtain insight on important health and safety issues.



Collection and Transfer Courses

SWANA'S ON-LINE TRAINING COURSES

Why "waste" an opportunity to improve your safety performance? At SWANA, we recognize the importance of minimizing risk and developing an effective safety program for transfer station personnel. During this course, you will get an overview of OSHA and federal regulations. Also, you will discuss musculo-skeletal disorders and how to prevent ergonomic injuries. Upon completion, you will understand why it is essential to establish a transfer station health and safety program as well as learn to recognize unsafe practices of others. Earn valuable SWANA CEUs for a range of Certification Disciplines by participating in this extremely important course!

HEALTH AND SAFETY FOR TRANSFER STATION PERSONNEL

1-Day Course

Does it pain you to see the unsafe work habits of your collection personnel? Well let SWANA help you reduce those pains with our Health and Safety for Collections Personnel Course. This kit comes with everything a supervisor or manager needs to train their employees on proper techniques and precautions to reduce workplace injuries. Other topics covered in this course include loss control, and health and safety issues, as well as regulatory issues.

Appendix B
Site Specific Training
Lesson Plan and Exam

Pre-Entry Briefing

Objective: The objective of this pre-entry briefing is to introduce visitors and first-day employees to the safety controls of the BRC CAMU. Attendees should understand where active portions of the site are, where emergency response equipment is located, site hazards (chemical, physical, biological), and general safety rules of the BRC CAMU.

Active Areas
Indicate on map:

- haul routes
- waste excavation (exclusion, contamination reduction, support zones, as appropriate)
- waste placement (exclusion, contamination reduction, support zones, as appropriate)

Emergency Response:

Contact Name

Phone number(s)

Hospital Location

Location of emergency equipment (fire extinguishers, alarms)

Meeting location(s)

First Aid steps: Check-Call-Care

Personal Protection Equipment

Hardhat – at all times

Steel Toe Boots – at all times

Eye protection – at all times

Hearing Protection – where applicable

Tyvek – where applicable

Gloves – where applicable

Respirator – where applicable

Basic Site Safety:

1. Keep your mind on your work at all times. No horseplay on the job. Injury or termination or both can be the result.

2. Personal safety equipment must be worn as prescribed for each job, such as: safety glasses for eye protection, hard hats at all times, gloves when handling materials, and safety shoes..

3. Watch where you are walking. Don't run.

4. Seat belts are required at all times when driving/operating.

5. The use of illegal drugs or alcohol or being under the influence of the same on the project shall be cause for your immediate termination. Inform your supervisor if taking strong prescription drugs that warn against driving or using machinery.

6. Do not distract the attention of fellow workers. Do no engage in any act that would endanger another employee.

7. Sanitation facilities are provided for your use. Defacing or damaging these facilities is forbidden.

8. Never move an injured person unless it is absolutely necessary. Further injury may result. Keep the injured as comfortable as possible and utilize job site first-aid equipment until an ambulance arrives.

9. Know where firefighting equipment is located and be trained on how to use it.

10. Nobody but operator shall be allowed to ride on equipment unless proper seating is provided.

11. Do not use power tools and equipment until you have been properly instructed in the safe work methods and become authorized to use them.

12. Do not enter an area that is barricaded or otherwise blocked from entry.

13. If you must work around trucks or heavy equipment, make sure operators can always see you and know that you are there. Barricades are required for cranes.

14. Never oil, lubricate, or fuel equipment while it is running or in motion. Do not perform these operations on equipment in areas not specifically designated for these operations.

15. Before servicing, repairing, or adjusting any powered tool or piece of equipment, disconnect it, lock out the source of power, and tag it out.

16. Barricade danger areas. Guard rails or perimeter cables may be required.

17. Trenches over five feet deep must be shored or sloped as required. Keep out of trenches or cuts that have not been properly shored or sloped. Excavated or other material shall not be stored nearer than two feet from the edge of the excavation. Excavations less than 5 ft may also require cave in protection.

18. Use the "four and one" rule when using a ladder. One foot of base for every four feet of height.

19. Know what emergency procedures have been established for your job site. (location of first aid kit, fire extinguisher locations, evacuation plan, etc.)

Hazard Analysis

Physical
Heat Stress
Excavation
Hand/Foot Injury
Heavy Equipment
Noise
Portable Power/Hand Tool
Slip/Trip/Fall

Chemical
Inhalation
Skin absorption
Fire
Reactivity

Insect/Vermin/Snake Bites

Exam

The pre-entry briefing exam will be taken at the conclusion of the meeting. A passing rate of 75% is required for access to the site. Incorrect answers will be explained and topics covered again.

Pre-entry Briefing Exam

Name:_____
I have read and understand the BRC CAMU Health and Safety Plan Yes No
Date:_____

Position:_____

1. What are the three emergency first aid steps?

   A. Stop-Look-Listen
   B. Call-Check-Care
   C. Check-Call-Care
   D. None of the Above

2. You are working near an excavator, what PPE do you need?

   A. Hardhat, boots, eye protection, hearing protection
   B. Boots, hardhat
   C. Hardhat, hearing protection
   D. None of the above

3. When excavating, at what depth is shoring required?

   A. 3 feet
   B. 1 foot
   C. 5 feet
   D. 2 feet

4. You are not 24-hour or 40-hour HAZWOPER certified, how close can you be to the excavation or waste placement activities?

   A. Exclusion Zone
   B. Contamination Reduction Zone
   C. Support Zone
   D. None of the Above

5. What's the first step in an emergency?

   A. Call BRC
   B. Go to a safe location
   C. Go Home
   D. None of the above

Number Incorrect:_____ Pass / Fail Trainer's Name:_____

1.0 INTRODUCTION

This Accident Prevention, Contingency, and Emergency Response Plan describes the precautions to be taken to minimize the possibility of, and hazards from, a fire, explosion, or unplanned sudden or non-sudden release of hazardous waste constituent to air, soil, or surface water. These procedures also address the maintenance and operating practices designed to reduce the potential for injury or other threats to human health or the environment.

1.1 Contaminants

Extensive testing of the waste material determined the majority of wastes to be non-hazardous. The following is a list of general contaminants found in the waste material placed in the CAMU:

- VOCs
- SVOCs
- PCBs
- Metals
- Pesticides

The waste materials are not incompatible, reactive, or ignitable. Additional waste characterization detail can be found in Attachment C, Waste Analysis Plan.

2.0 PREVENTION

2.1 Health and Safety Plan

The BRC CAMU has an active Health and Safety program for post-closure workers at the BRC CAMU. Contractors performing post-closure inspections, maintenance, and/or construction will develop their own site-specific health and safety plan (HASP) or follow the current BRC Health and Safety Plan. The current BRC HASP will be maintained at the BRC Offices located at 875 West Warm Springs Road or onsite while personnel are working. A safety meeting will be held prior to beginning post-closure work at the Site. Daily safety tailgate meetings will address health and safety issues of the day. Employees working at the BRC CAMU will attend. Personal safety equipment such as eye protection, steel-toed boots and hard hats will be required of all BRC CAMU non-office personnel. In case of personal injury, the field office will be notified immediately by two-way radio or cellular telephone and, if necessary, an ambulance summoned from the local hospital, St. Rose de Lima approximately 1 ¼

miles from the BRC CAMU (Figure G-1), or the local (City of Henderson or Clark County) Fire Department.

2.2 Personal Protective Equipment (PPE)

Level D PPE will be required at all times at the Site. Level D equipment required includes long pants, gloves, steel-toe boots, hard hats, safety glasses, and hearing protection (when appropriate). CAMU maintenance Contractors may require higher PPE levels for specific jobs as required by their HASPs.

2.3 Exposure Assessment and Air Monitoring

Individual HASPs developed for post-closure site work will assess exposure risk and the need for air monitoring, if appropriate. Air monitoring may not be necessary if waste is not disturbed by post-closure activities.

2.4 Activity Hazard Analysis

The chemical, physical, and biological hazards will be discussed in detail in the Site HASP for each activity performed on-site.

2.5 Personnel Training

Employees assisting in construction activities which disturb waste and/or leachate collection and control systems will have Occupational Safety and Health Administration (OSHA) 40-hr Hazardous Waste Operations and Emergency Response Standards (HAZWOPER) certification. In addition, BRC and/or the contractors' on-site supervisor will have 8-hr OSHA Site Supervisor training. Contractors are responsible for knowing the site chemical, biological, and physical hazards as well as how to prevent accidental release of wastes.

2.6 Site Map

HASPs developed by each contractor performing post-closure work at the CAMU will include a site map. The site map will indicate where the work will be performed and, if waste is disturbed, the exclusion zone, decontamination zone, and support zone. The site map shall be maintained in the work area and will include the following information:

- General Wind Direction
- Evacuation Routes
- Refuge Locations
- Route to St. Rose de Lima Hospital and First Aid Medical Assistance (may be provided on separate map)
- Boundaries of Exclusion Zone (as described below)
- Boundaries of Contamination Reduction Zone (as described below)
- Boundaries of Support Zone (as described below)

Changes will be made to the site map by the contractors' supervisor(s), as needed, based on site conditions.

2.6.1 Work Zones

Three work zones will be established for each waste-disturbing task. The Exclusion Zone is defined as the area on-site where contamination is suspected and tasks are to be performed. The Contamination Reduction Zone (CRZ) is defined as the area where equipment and workers are to be decontaminated. The Support Zone is defined as the command area and also serves as a storage area for supplies. The exact location and extent of the work zones will be modified as necessary.

2.7 Site Access

Access to the site will be controlled by contacting the BRC Emergency Coordinator.

2.8 Visitors

Visitors to the site will be continually escorted in order to assure their safety since they may be unfamiliar with the site. Visitors will not be allowed past the Support Zone unless they read, understand, sign, and meet the requirements outlined in the BRC and/or contractors' HASP.

2.9 Communications

On- and off-site communications will be conducted through the use of mobile telephone.

2.10 Safe Work Practices

General Safe Work Practices that will be implemented during work activities at this site and incorporated into the post-closure contractors' HASPs are:

- Minimization of contact with waste materials by limiting disturbance of the final cover.

- Smoking, eating, or drinking after entering the work zone and before decontamination will not be allowed. Employees who are suspected of being under the influence of illegal drugs or alcohol will be removed from the site. Workers taking prescribed medication that may cause drowsiness will not be permitted to operate heavy equipment, and will be prohibited from performing tasks where Level C, B, or A PPE is required.

- Good housekeeping will be practiced.

- Use of contact lenses on-site will not be allowed when dictated by working conditions.

- The following conditions will be observed when operating a motor vehicle.

  - Wearing of seat belts is mandatory

  - During periods of rain, fog, or other adverse weather conditions, the use of headlights is mandatory

  - A backup warning system or use of vehicle horn is mandatory when the vehicle is engaged in a backward motion

  - All posted traffic signs and directions from flagmen will be observed

  - Equipment and/or samples transported in vehicles will be secured from movement

- In an unknown situation, the worst conditions will always be assumed.

- Conflicting situations may arise concerning safety requirements and working conditions and will be addressed and resolved rapidly by BRC to relieve any motivations or pressures to circumvent established safety policies.

- Breaches of specified safety protocol will not be allowed.

2.11 Inspections

BRC may conduct spot checks on the post-closure contractors' health and safety practices.

2.12 Decontamination

PPE will be decontaminated as per 29 CFR §1910.120(k). The decontamination procedures, equipment and decontamination solution required for each task will be included in the post-closure contractors' HASP. In an emergency, the primary concern is to prevent the loss of life or severe injury to site personnel. If immediate medical treatment is required to save a life, decontamination will be delayed until the victim is stabilized. If decontamination can be performed without interfering with essential life-saving measures or first aid, or if worker has been contaminated with an extremely toxic or corrosive material that could cause severe injury or loss of life, decontamination will be performed in coordination with or prior to initial medical treatment at the scene.

3.0 CONTINGENCY AND EMERGENCY RESPONSE PLAN

3.1 Fire Control

Fire extinguishers will be in field vehicles to put out small fires near the working area, in the remote possibility they may occur. In the event of a significant fire emergency, the Henderson Fire Department will be notified immediately and the emergency will be reported.

3.2 Hazardous or Toxic Materials Release

A Hazardous Materials Emergency Plan will be incorporated into each post-closure Contractors' Health and Safety Plan. It will mainly focus on those chemicals and materials associated with leachate management and vehicle fueling and

maintenance; however, additional hazardous materials associated with each post-closure Contractors' specific work elements will also be included.

3.3 Unanticipated Cover Breach

If the cover system is impacted resulting in the potential for water infiltration and/or waste release, the BRC Emergency Coordinator will be contacted. The BRC Emergency Coordinator will notify NDEP within 24-hours of cover breach identification. BRC will delineate the extent of damage and, if necessary, identify temporary control measures to prevent further damage or release (e.g., tarping of damaged area(s)). BRC will repair impacts to the cover in accordance with the CQA Plan (SRAPI, Section 10) within 30 calendar days.

3.4 Emergency Procedures

The following steps will be followed when there is a life-threatening emergency:

1. BRC, or alternate, will be immediately notified. BRC assumes control of the emergency response.

2. As necessary, off-site emergency responders (e.g., fire department, hospital, police department, etc.) will be notified as to the nature and location of the emergency on site. Please see Table G-1 for contact information.

3. If applicable, BRC evacuates the site. Site workers will move to their respective refuge stations using the evacuation routes provided on the Site Map.

4. BRC CAMU Emergency Coordinator will assess possible hazards to human health or the environment resulting from the emergency and shall contact the appropriate authorities for the Henderson, Nevada area or the National Response Center (toll free: (800) 424-8802). The report will include:

    a. Name and telephone number of the reporter;

    b. Name and address of the BRC CAMU;

    c. Time and type of incident;

d. Name and quantity of material(s) involved, to the extent known;

e. The extent of injuries, if any; and

f. The possible hazards to human health, or the environment, outside the facility.

5. For small fires, flames will be extinguished using the fire extinguisher. Large fires will be handled by the fire department.

6. In an unknown situation or if responding to toxic gas emergencies, appropriate PPE, including SCBAs, will be donned.

7. If chemicals are accidentally spilled or splashed into eyes or on skin, safety eyewash and/or shower will be used.

8. Before continuing site operations, after an emergency involving toxic gas, BRC will don a SCBA and utilize appropriate air monitoring equipment to verify that the site is safe.

9. An injured worker shall be decontaminated appropriately.

10. If a worker is injured, first aid will be administered by workers certified in first aid.

3.5 Reporting

BRC will note in the post-closure record the time, date, and details of any incident that requires implementing this plan. The report will be submitted to the NDEP and include:

a. Name, address, and telephone number of the owner or operator;

b. Name, address, and telephone number of the facility;

c. Date, time, and type of incident;

d. Name and quantity of material(s) involved;

e. The extent of injuries, if any;

f. An assessment of actual or potential hazards to human health or the environment, where applicable; and

g. The estimated quantity and disposition of recovered material that resulted from the incident.

Incident reports will be kept as part of the post-closure records and maintained by BRC for at least 3 years and otherwise in accordance with the records retention provision of the AOC3.

Copies of Letters Sent to Police, Fire, and Hospital Emergency Contacts

Basic Remediation
COMPANY

August 24, 2020

Mr. Thedrick Andres
Chief of Police
Henderson Police Department
P.O. Box 95050
Henderson, Nevada 89009

Dear Mr. Andres,

As you may know, clean-up and restoration activities have been completed for the 2,200-acre site located east of Boulder Highway and owned by our affiliate, the LandWell Company. However, post-closure monitoring of the corrective action management unit (CAMU) constructed during clean-up and restoration will continue over the next few decades, and will consist of periodic site maintenance, inspections, and repairs. Under the jurisdiction of the Nevada Division of Environmental Protection, we have developed an Accident Prevention, Contingency, and Emergency Response Plan for the post-closure monitoring period that include responses from police, fire, and medical professionals, as needed. We have designated the Henderson Police Department as a primary responder in the event of theft or assault. While we do not expect problems to arise that would require a response by the Police Department, we want to be prepared for such a contingency. If you would like a more detailed briefing on details of the post-closure period for the CAMU, I would be happy to provide this. Please contact me at 702-567-0400 and at LFarris@landwellco.com.

Sincerely,

BASIC REMEDIATION COMPANY

Lee C. Farris
Vice President

Basic Remediation
COMPANY

August 24, 2020

Mr. Tom Burns
Chief Operating Officer/Chief Nurse Executive
St. Rose Dominican Hospital – Rose de Lima
102 East Lake Mead Parkway
Henderson, Nevada 89015

Dear Mr. Burns,

As you may know, clean-up and restoration activities have been completed for the 2,200-acre site located east of Boulder Highway and owned by our affiliate, the LandWell Company. However, post-closure monitoring of the corrective action management unit (CAMU) constructed during clean-up and restoration will continue over the next few decades, and will consist of periodic site maintenance, inspections, and repairs. Under the jurisdiction of the Nevada Division of Environmental Protection, we have developed an Accident Prevention, Contingency, and Emergency Response Plan for the post-closure monitoring period that include responses from police, fire, and medical professionals, as needed. We have designated St. Rose Dominican Hospital as a primary responder in the event of injury. While we do not expect problems to arise that would require a response by the hospital's emergency room, we want to be prepared for such a contingency. If you would like a more detailed briefing on details of the post-closure period for the CAMU, I would be happy to provide this. Please contact me at 702-567-0400 and at LFarris@landwellco.com.

Sincerely,

BASIC REMEDIATION COMPANY

Lee C. Farris

1.0 INTRODUCTION

The BRC CAMU emergency coordinator is completely familiar with the site operation and Accident Prevention, Contingency, and Emergency Response Plan. In addition, the emergency coordinator must be familiar with all activities at the facility, the location and characteristics of waste handled, the location of all records within the facility, and the layout. The emergency coordinator is responsible for directing the emergency procedures outlined in Attachment G. He or she shall have successfully completed all training and is responsible for the training records of all personnel outlined in Attachment G. The contact information for two additional individuals is also provided who can also fulfill this role.

1.0 INTRODUCTION

This attachment describes the geological, hydrogeological, and climatic conditions at the BRC CAMU. In addition, location standards and siting requirements for the BRC CAMU are discussed.

2.0 GEOLOGIC CONDITIONS

This section summarizes the geological conditions present at the BRC CAMU site. The Draft Conceptual Site Model (CSM) for the Common Areas prepared by Daniel B. Stevens & Associates (DBS&A, 2006) provides greater detail about the geological and hydrogeological conditions at the site.

2.1 Geology

Regional Geology in Southern Nevada is the Basin and Range Province morphology of the Western Cordillera of North America. In this region, Cenozoic tectonic extension has resulted it a system of fault-bounded mountains separated by sediment-filled valleys. The basins consist of down-dropped blocks of crust while the ranges are upthrust slabs with a regional tilt to the east. The typical arrangement in the Basin and Range system is a valley bounded on each side by a normal fault running parallel to the range (DBS&A, 2006).

The BRC CAMU site is located in the Las Vegas Valley, a northwest-southeast trending basin within the Basin and Range Province. The predominate range influencing the BRC CAMU site conditions is the McCullough Mountains bounding the valley to the south (DBS&A, 2006).

Valley fill in the vicinity of the BRC CAMU site consists of Tertiary Muddy Creek Formation (TMCf) and overlying Quaternary Alluvium (Qa) associated with alluvial fan deposits shed from the McCullough Range Mountains. The Qa is the present-day land surface at the CAMU as well as in most of the Henderson area and has an average thickness of 50 to 60 feet. The Qa is predominantly sands and gravels classified as poorly graded gravels (GP), silty gravels (GM), well-graded sands (SW), poorly graded sands (SP), and silty sands (SM) in accordance with the Common Unified Soil Classification System (USCS) (DBS&A, 2006).

Beneath the BRC CAMU site, the boundary between the Qa and TMCf is an unconformity that represents a period of time when the TMCf strata was likely exposed to weathering and erosion. Erosion by streams originating in the McCullough Mountains cut into the TMCf resulting in paleochannels that were later filled by Qa. Two

paleochannels have been inferred in the vicinity of the CAMU site: one paleochannel from the south-central area to the northwest corner and a second paleochannel from the northeast corner of the CAMU site trending almost due north (DBS&A, 2006).

Beneath the Qa is lies the TMCf consisting of predominantly fine-grained sandy silts and clayey silts. Layers with increasing sand content are encountered. With the increasing distance east and north from the McCullough Range, the proportion of coarse-grained sediments in the upper portion of the TMCf appears to decrease. The total thickness of the TMCf is unknown with measurements varying from 2,158 feet to 3,050 (DBS&A, 2006).

2.2 Hydrogeology

Groundwater flow beneath the BRC CAMU site is generally to the north, northeast. Groundwater ranges from approximately 1725 ft Mean Sea Level (MSL) to 1695 ft MSL from the southern to northern areas of the BRC CAMU (Figure C7). The groundwater flow is approximately parallel to the slope of the land surface. The average gradient of the water table ranges from about 0.02 to 0.04 ft/ft with a hydraulic conductivity typically ranging from a few inches to up to 33 feet per day (ft/d). The Qa is unsaturated towards the east, with saturation first noted in the uppermost TMCf, near the contact between the Qa and the TMCf. The groundwater treatment system located on the eastern property adjacent to the CAMU is thought to have dewatered the Qa (DBS&A, 2006).

Groundwater quality in the Qa is poor. General water quality analysis performed on a groundwater sample collected from Kerr-McGee monitoring well M-10, which is installed upgradient of the BMI Complex, reported relatively high concentrations of total dissolved solids (2,680 mg/L), chloride (732 mg/L), and sulfate (857 mg/L) (ERM-West Inc., 1996).

Beneath the Qa, within the TMCf, groundwater exists generally under confined conditions in saturated coarser-grained lenses. Water in wells screened in the upper portion of the TMCf rose under the confining pressure to elevations within the Qa indicating an upward flux gradient from the TMCf into the overlying alluvium. The hydraulic conductivity in the TMCf was approximately 12 ft/d (DBS&A, 2006).

Recharge to the Qa due to precipitation is generally considered to be negligible but has increased in recent years due to increasing irrigation infiltration, sewage treatment plant effluent, and from the removal of phreatophytic vegetation near the washes (Geraghty & Miller, 1993). Natural discharge from the Qa is primarily due to springs, direct evaporation, and evapotranspiration, with little or no water discharging to the Las Vegas Wash (Geraghty & Miller, 1993, after USBR, 1982).

3.0 CLIMATE

The Las Vegas Valley is one of the driest and warmest areas in the nation. The climate consists of hot summers, and cool winters. Summer temperatures above 105° Fahrenheit (F) and winter temperatures below freezing are common. The average daily minimum and maximum temperatures during winter months are about 35º and 60º F. During summer nights, minimum temperatures average 70º to 75º F. The frost-free period averages about 241 days per year (Geraghty & Miller, 1993, after USBR, 1982).

The Las Vegas Valley is characterized by low annual rainfall, approximately 4.5 inches per year, that fall during two rainy seasons. During the winter, the rainfall is generally low-intensity and falls over a wide area. In the spring and fall, local thunderstorms subject the area to high-intensity rains of short duration, which can cause high-runoff conditions. Maximum rainfall within a 24-hour period for a 25-year storm is approximately 2.3 inches (NOAA Atlas 2, undated) in the site area.

Evaporation is high in the Las Vegas Valley, influenced by high temperatures, high winds, and low humidity (average 20%). Pan evaporation data form the period of 1985 through 1988 range from approximately 2.5 inches/month to more than 17 inches/month (ERM-West, Inc., 1996, after Law Engineering, 1993). The months with the highest evaporation (May through September) correspond to the times of high-intensity rainfall, which indicates that rainfall does not contribute significantly to the recharge of groundwater in this area (ERM-West, 1996). Measurements of evaporation at Boulder City and Lake Mead indicate an annual loss of about 6.5 feet of water, three-fourths of which occurs during the six warmer months. The evapotranspiration within Las Vegas Wash is expected to be significantly higher due to high consumptive use by cattails, warmer temperatures, and lower humidity (Geraghty & Miller, 1993, after USBR, 1982).

Winds are typically out of the southwest or northwest and average nine miles per hour (mph). Gusts greater than 50 mph occur several times a year during the massage of major frontal systems. Topography influences the wind flow patterns.

4.0 LOCATION RESTRICTIONS

4.1 Flood Plains

The BRC CAMU is located in an area determined to be outside the 100-year flood plain (Figure I-1) (FEMA, 2002).

4.2 Fault Areas

The BRC CAMU is not located within 200 feet of a fault that has had displacement in Holocene time. Two north-trending fault scarps are located approximately ½ mile northwest and southwest of the BRC CAMU (Figure I-2) (Converse Consultants, 1999). Displacement on both faults is recorded as pre-Holocene.

4.3 Seismic Impact Zones

The BRC CAMU is located in a seismic impact zone (USGS, 1982). The site is located in an area with a 10 percent or greater probability that the maximum horizontal acceleration in lithified earth material will exceed 10 percent of the earth's gravitational pull in 250 years (USGS, 1982). The maximum horizontal acceleration depicted on the seismic hazard map with a 90 percent or greater probability that the acceleration will not be exceeded in 250 years is 14 percent of the earth's gravity. The peak horizontal ground acceleration recommended for the design of the project is 0.15g (Converse Consultants, 1999). A soil profile type of S_D per Table 16-J of the 1997 Uniform Building Code is recommended for the site.

Structures for containment, including liners, systems for the collection of leachate and systems for the control of surface water, were designed to resist the maximum horizontal acceleration in lithified earth material for the site. Proof of meeting these design requirements is provided in the SRAPI Sections 2 and 5.

4.4 Unstable Areas

The slit trenches were previously located beneath Phases IIIB, IV, and V of the CAMU. The waste was placed in the trenches without compaction effort and covered with previously excavated native material. As a result of the waste being placed without compaction, the "slit trenches" had experienced settlement over the years.

The slit trench waste was excavated and placed into Phases I, II, and IIIA. Waste was placed in accordance with the Final Construction Technical Specifications (SRAPI, Section 9). Placement of the Slit Trench waste is described in the CAMU Partial Final Closure Construction Quality Assurance Report for Phases I, IIIB, IV, and Portions of Phases II and V (Geosyntec, 2010). Following waste removal, a portion of the slit trenches were backfilled to meet liner grades as shown on the Final Construction Drawings (Attachment P-1).

This section has not been updated and reflects the conceptual design and design assumptions prior to final design development. Final design documents are located in Attachment P (Final Design Drawings), Final Technical Specifications (SRAPI, Section 9), Final CQA Plan (SRAPI, Section 10). In addition, changes to the final design documents, including revised calculations, are detailed in the Design Change Notifications located in the Final CQA Reports (SRAPI Sections 11 through 21).

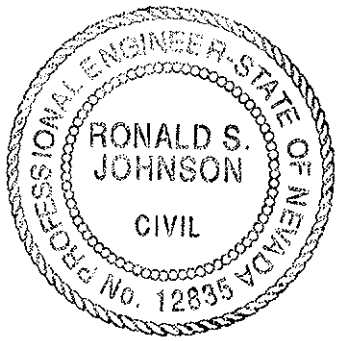
CONCEPTUAL DESIGN FOR
THE CONSTRUCTION OF
THE BASIC REMEDIATION COMPANY
CORRECTIVE ACTION MANAGEMENT UNIT

HENDERSON, NEVADA

The Engineering material and data contained in this Conceptual Design Plan were prepared under the supervision and direction of the undersigned, whose seal as a registered Professional Engineer is affixed below.

The Engineering system in this conceptual design will prevent the migration of any hazardous constituents into the ground water or surface water at least as effectively as the liner and leachate collection and removal system specified in 40 CFR 264.301(c).

Ronald Johnson, P.E.
Nevada No. 12835



1.0 INTRODUCTION

This conceptual design is prepared in accordance with 40 CFR Parts 264, 266 and 268. The technical approaches discussed in this section are intended to outline the key conceptual design features and components of the proposed landfill. Upon regulatory review and approval, the conceptual design will be refined to provide detailed specifications to meet the design standards and performance criteria outlined in this permit.

1.1 Maps and Plans

A series of maps, plans and cross-sections referenced throughout this section is located in Section 1 of the Supplemental RAP Information (SRAPI). The design plans include the following:

- Figure J-1 – Title Sheet and Drawing List (includes general location map).
- Figure J-2 – Legend, Abbreviations, and General Notes;
- Figure J-3 – Overall Site Plan;
- Figure J-4 – Construction Sequence Plan;
- Figure J-5 – Surcharge Plan;
- Figure J-6 – Site Preparation Plan;
- Figure J-7 – Construction Grading Plan;
- Figure J-8 – Storm Drain Plan;
- Figure J-9 – Final Cover Grading Plan;
- Figure J-10 – Cross Sections
- Figure J-11 – Final Cover and Liner Details and Sections;
- Figure J-12 – Fence Plan.

1.2 Anticipated Waste Material

The source materials for the proposed BRC CAMU include approximately 3.7 million cubic yards of residual solids (i.e., sediments and associated soils) from the industrial ponds, ditches, and other source areas within the BMI Common Areas known as the Eastside Area, slit trenches, and western ditch within the BRC CAMU area. Extensive testing of the waste material has determined the majority of wastes to be non-hazardous. Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), and Polychlorinated Biphenyls (PCBs) were detected sporadically, with VOCs and SVOCs throughout the site and PCBs in the Beta Ditch and first eight Upper Pond rows. Pesticides, metals, and cyanide were detected at low levels in the Beta Ditch and first eight Upper Pond rows. Asbestos was tested at measureable levels in the Beta Ditch and first eight Upper Pond rows. These wastes are not incompatible, reactive, or

ignitable. Additional waste characterization detail can be found in the Waste Analysis Plan (Attachment C). No wastes will be accepted from other sources.

Unlike typical landfills, both the source material and the proposed BRC CAMU will be under sole control of BRC. Consequently, there will be direct control over the types of waste materials placed at the BRC CAMU. Physical and chemical descriptions of the anticipated waste materials are presented in the Waste Analysis Plan (Attachment C).

1.2.1 Predicted Leachate Generation

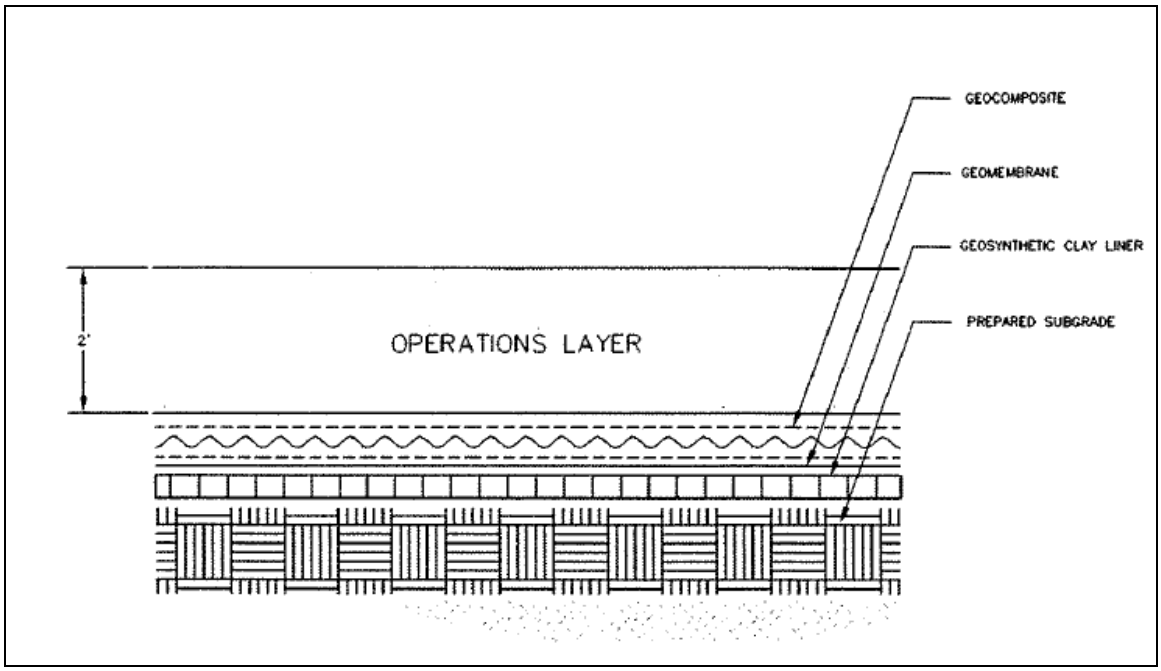
In the case of the proposed BRC CAMU, the mass of waste material will be compacted in place to form a hard-packed, monolithic "block," through which little or no saturated flow is expected to occur. Achieving the most favorable hydraulic conductivity in the compacted sediments depends on the degree of compaction, compaction method, type of soil, soil moisture content, and *in-situ* density. Wet waste sediments from the TIMET ponds will be mixed with dry solids, or otherwise dewatered, and then transported and placed to maintain a moisture content below that which is capable of generating leachate. The process will be designed such that waste sediments placed in the landfill meet the density and moisture content requirements that will in turn reduce leachate generation.

While waste material placed within the landfill will not be intrinsically capable of generating leachate, the ability for the landfill to produce leachate will be dependent on the quantity of the water allowed to infiltrate the interim and final cover materials and penetrate into the underlying waste materials. Therefore, final cover design and operational specifications for interim covers are important for the landfill system to provide for protection of the waters of the state. For this reason, the proposed interim and final cover are designed to reduce infiltration of water as described in Attachment O (Closure and Post-Closure Plan) and Attachment P (Final Cover Design).

2.0 LINER DESIGN

2.1 Liner and Leachate Collection System

A composite liner and leachate collection system is proposed as shown in cross-sections in Detail J-1 below. The composite liner will underlie the waste materials, providing a barrier to the underlying native soils and groundwater. Although leachate generation is not anticipated, this liner system is designed with a leachate collection system to reduce potential liquid accumulation at the base of the waste materials. Liner and leachate collection components will be constructed of materials having appropriate strength and chemical compatibility.



DETAIL J- 1, COMPOSITE LINER LAYOUT

As shown in Detail J-1 above, the liner system is anticipated to consist of the following elements, or layers, from top to bottom: a geocomposite drainage layer, a geomembrane, and a geosynthetic clay liner (GCL). GCLs consist of a layer of bentonite-clay-backed geotextile. GCLs exhibit properties of low permeability soil liners, and have successfully substituted for the soil component in composite liner designs. Placement of a GCL under the geomembrane is commonly employed to increase effectiveness of the composite liner by limiting flow through potential flaws or pinholes in the geomembrane.

Geomembranes are relatively thin sheets of flexible polymeric materials that are manufactured and prefabricated at a factory and transported to the site. Because of their inherent impermeability, use of geomembranes in landfill construction is typically standard in the industry. Geomembranes are made of one or more polymers along with a variety of other ingredients such as carbon black, pigments, fillers, plasticizers, processing aids, crosslinking chemicals, anti-degradants, and biocides. The polymers used to manufacture geomembranes include a wide range of plastics differing in properties such as chemical resistance and basic composition. The polymeric materials may be categorized as follows:

- Thermoplastics such as polyvinyl chloride (PVC);

- Crystalline thermoplastics such as high density polyethylene (HDPE), low density polyethylene (LDPE), and linear low density polyethylene (LLDPE); and

- Thermoplastic elastomers such as chlorosulfonated polyethylene (CSPE).

The polymeric materials used most frequently as geomembranes are HDPE, PVC, and CSPE. Geomembrane thickness range from 20 to 120 mil (1 mil = 0.001 inch). The recommended minimum thickness for all geomembranes is 30 mil, with the exception of HDPE, which must be at least 60 mil. A 60-mil HDPE geomembrane is proposed for the BRC CAMU, which is widely recognized in the industry as a very chemically resistant, durable, long-lasting material.

Geocomposite is to be placed on the geomembrane to protect it from puncture by the overlying operations layer soil. The geocomposite is designed to allow leachate, if generated by the waste materials, to flow toward perforated HDPE collection piping and be collected at the pump-out locations. The base grade of the landfill is engineered to slope toward these leachate collection areas.

Components of the leachate collection system (LCS) will have sufficient strength to support overlying compressive stresses. Pipe strength calculations will include resistance to wall crushing, pipe deflection, and buckling pressure. Perforated drainage pipes have been shown to provide good long-term performance in LCSs (USEPA, 1993).

Geotextile filter is a component of the geocomposite that will reduce physical clogging of the drainage layer from the overlying fine-grained material.

The liner system is intended to work together with other design components to isolate the waste materials from the environment. The main objective of BRC CAMU design is to provide a design that protects waters of the state. Design components that are intended to accomplish this objective are as follows:

1. The final cover, or cap, of the landfill is designed to allow essentially no infiltration of water into the waste materials. The final cover is described in the CAMU (Landfill) Closure and Post Closure Plan (Attachment O). A solar field is contemplated to be installed and operated by a third party on top of the final cover. For additional details see Section 3.0 of the application.

2. The waste material will be processed and compacted to the degree necessary to reduce saturated flow within the interred materials. As discussed earlier, material from the TIMET ponds will be mixed with dry soils or dewatered, as necessary, prior to interment in the BRC CAMU. Together with a cap that reduces infiltration in an arid environment, the

resulting potential for contaminant mobilization and leachate generation is considered minimal.

3. In addition to the above precautions, the underlying liner system will be designed to collect leachate generated, thereby providing an additional factor of safety in reducing waste migration into the groundwater.

4. The base of the landfill will be at least 5 feet higher than first groundwater at the groundwater's highest elevation, providing a buffer between groundwater and the landfill (Appendix A).

Engineering design calculations and construction specifications for the base liner system and leachate collection system are presented with the Supplemental RAP Information (SRAPI), Sections 2 and 4, respectively. A summary is provided in the following section.

3.0 SUMMARY OF ENGINEERING ANALYSIS

3.1 General

This section summarizes the results of the conceptual design calculations performed for the base liner system at the BRC CAMU Landfill site. The following calculations were performed:

- Slope Stability Evaluation - Cut Slopes (Calculation Package A);
- Slope Stability Evaluation - Final Waste Slopes (Calculation Package B);
- Drainage Pipe Size Calculations (Calculation Package C);
- Pipe Strength Calculations (Calculation Package D);
- Veneer Stability Calculations (Calculation Package E);
- Geotextile Separation/Filtration Calculations (Calculation Package F);
- Geotextile Puncture Protection Calculations (Calculation Package G);
- Sump Capacity Calculations (Calculation Package H);
- Comparison of Flow Through the Prescriptive Composite Liner and a Proposed Alternative Composite Liner (Calculation Package I);
- Tension Due to Wind Uplift (Calculation Package J);
- Evaluation of Liner System Anchor Capacity (Calculation Package K);
- Drainage Geocomposite Equivalency Demonstration (Calculation Package L); and
- Consolidation Analyses (Calculation Packages M and N)

The base liner system calculations are based on the conceptual design grading plans shown on Figures J-7 and J-9 Additional calculations may have to be performed if there are changes to elevation and grade in the aforementioned design grading plans.

3.2 Slope Stability Evaluation

3.2.1 General

This section summarizes the analyses performed for the cut slopes and the final waste slopes. The analyses summarized herein are for static stability. Seismic site response, stability, and permanent deformation analyses are presented in Attachment O.

3.2.2 Cut Slopes

Slope stability was evaluated for the proposed cut slopes for the BRC CAMU. One cross-section was analyzed that represents the most critical case. Cut slopes with the highest height, weakest materials, and/or steepest slope are chosen for this analysis. The analyzed native soil cut slope has a height of approximately 44 ft and a base sloping at 3%. The proposed native soil cut slopes are at a slope angle of 2.1:1 (horizontal:vertical). The material properties selected and used in these analyses were based on a preliminary investigation by Converse Consultants, Inc. [Converse, 1999]. The calculations suggest that the most critical potential failure surface of the 2.1H:1V native soil cut slope possesses a factor of safety of approximately 1.5. Since the native soil cut slopes are considered interim, seismic evaluations were not conducted. Native soil cut slope stability calculations are presented in Section 2, Calculation Package A of the SRAPI.

3.2.3 Final Waste Slopes

The stability of the final waste slopes for the BRC CAMU was analyzed. Two cross-sections were analyzed that represent the most critical cases. Similar to cut slope analysis, waste slopes with the highest height, weakest materials, and/or steepest slope are chosen for this analysis. Originally, the analyzed final waste slope has a height of approximately 47 ft above surrounding grades at a slope angle of 3:1 (horizontal:vertical). Waste testing performed during waste placement as described in the Revised Waste Placement and Processing Plan was used to define waste material properties (Geosyntec, 2008). The calculations suggest that an apparent internal or interface friction angle of 11 degrees and 625 psf adhesion for any component of the composite liner system is the minimum allowable value provides a static factor of safety of 2.0. Furthermore, the calculations suggest that the yield acceleration for the final waste slopes is approximately 1.10 g (where "g" is the gravitational acceleration of 32.2 ft/s^2).

Design Change Notifications (DCNs) 47 and 48, issued during construction of the BRC CAMU, increased the height of the CAMU by an additional 34 ft, total. The additional waste was placed with 3H:1V slopes. The increased waste slopes were offset from the original 47 ft waste slopes by a minimum 10 ft wide bench. The material

properties selected and used in the analyses were based on the results of conformance testing performed during construction of the CAMU. The calculations suggest that the minimum interface friction angle of 11 degrees with 625 psf adhesion resulting from interface shear conformance testing for the composite liner system provides a static factor of safety of 2.0. The original and revised final waste slope stability calculations are presented in Section 2, Calculation Package B of the SRAPI.

3.3 Drainage Pipe Size Requirement

Drainage pipes will be placed on the base liner system to collect and transport potential leachate to the sump for removal. Analyses were performed to model leachate generation by using the Hydrologic Evaluation of Landfill Performance (HELP) model. The calculations suggest that a 4-inch diameter pipe with four 1/4-inch perforations spaced at 1-ft intervals will accommodate the flow predicted by HELP model analyses. Larger perforations are permitted if pipes are wrapped in filter geotextile to limit drainage rock intrusion. Drainage pipe size calculations are presented in Section 2, Calculation Package C of the SRAPI.

3.4 Pipe Strength

Based on drainage pipe size analyses, a 4-inch diameter drainage pipe will be used for leachate collection and transport. 12- and 18- inch diameter pipes will be used for the side slope riser for the vadose zone and leachate collection sumps, respectively. Based on the calculations performed for the 4-inch diameter drainage pipe and the 12- and 18-inch diameter side slope riser, the appropriate standard dimension ratio (SDR) is 13.5 or smaller. This calculation assumes the maximum height above the pipe of waste is 93 ft (South Mesa). Pipe strength calculations are presented in Section 2, Calculation Package D of the SRAPI.

3.5 Veneer Stability

The design criteria for the side slope liner system is to develop zero tension in the geosynthetics during installation of the operations layer on the side slopes. Potential causes of tension in the liner system include construction equipment loading and overburden stresses (e.g., operations layer materials). Based on the proposed grades and expected construction conditions, the calculations suggest that the side slope liner system will not be placed into tension provided a minimum dry interface friction angle of 18 degrees is maintained and the operations layer is staged in 10-ft high increments inclined at 2.5H:1V. Veneer stability calculations are presented in Section 2, Calculation Package E of the SRAPI.

3.6 Geotextile/Separation/Filtration Requirements

A separation/filtration geotextile will be placed between the operations layer and the drainage aggregate surrounding the leachate collection pipe and as a component of the geocomposite drainage layer. The purpose of the geotextile is to limit migration of fine material from the operations layer into the drainage aggregate and/or geonet component of the geocomposite. The calculations suggest that the separation/filtration geotextile overlying the drainage aggregate layer has an apparent opening size (AOS) greater than Sieve No. 70, a permittivity greater than 0.8 sec^{-1}, a minimum mass per unit area of 6 $oz./yd^2$, and sufficient mechanical properties. Geotextile separation/filtration calculations are presented in Section 2, Calculation Package F of the SRAPI.

3.7 Geotextile Cushion Protection

The geomembrane needs to be protected from puncture by particles from the prepared subgrade and operations material. Based upon the selection of using a geocomposite as the drainage layer in the leachate collection system, the geocomposite is selected such that the combined weight of the geocomposite geotextiles will act as an equivalent cushion. With respect to subgrade puncture, the geotextile components of the GCL will protect the geomembrane from the prepared subgrade. This calculation is based on a maximum overburden height of 93 feet. The analysis suggests that the following maximum particle sizes and geotextile mass per unit areas will be required:

Soil Component of Liner	Maximum Particle Size	Minimum Mass per Unit Area
Subgrade	0.75 inch	9 $oz./yd^2$ (GCL)
Angular Drainage Aggregate	1.00 inch	16 $oz./yd^2$

TABLE J -1- CUSHION GEOTEXTILE REQUIREMENTS

Geotextile cushion protection calculations are presented in Section 2, Calculation Package G of the SRAPI.

3.8 Sump Capacity

The USEPA regulations limit the head over the liner system to less than 12 inches. Therefore, the available capacity to retain the peak daily runoff includes the sump and the volume of 12 inches of leachate in the geocomposite and operations layer extending away from the sump. The maximum, average daily runoff calculated from the HELP model analyses (see drainage pipe sizing calculation) is 231 ft^3. A sump will be located at four low points (Phases I, II, IIIB, and V). Each sump will be approximately 10 ft x 10 ft x 2 ft deep. The sump has a capacity of approximately 112 ft^3. The capacity of the drainage geocomposite/operations layer extending away from the sump (at a 12-

inch head) is greater than 342 ft^3. The combined capacity of the sump and drainage geocomposite/operations layer is 453 ft^3, which exceeds the maximum, average daily runoff noted above of 231 ft^3.

The capacity of the four sumps located throughout the site will be able to accommodate the anticipated peak daily flow (as evaluated from the HELP model – drainage pipe sizing calculation, Section 2, Calculation C of the SRAPI) and meet the EPA requirement of less than 12 inches of head over the liner. Sump and drainage aggregate capacity calculations are presented in Section 2, Calculation Package H of the SRAPI.

3.9 Comparison of Flow Through a CCL and GCL

The calculations suggest that the flow rate through the prescriptive composite liner system containing a compacted clay liner (CCL) is approximately 1.64 times greater than the flow rate through the alternative composite liner system containing a geosynthetic clay liner (GCL). The comparison calculations are presented in Section 2, Calculation Package I of the SRAPI.

3.10 Tension Due to Wind Uplift

The most critical scenario for wind uplift is after the 10-ft vertical height of operations material has been placed against the slope while the remainder of the geosynthetic liner is exposed on the upper portion of the slope. A UV-protective woven geotextile will be installed to overlie the exposed portions of geosynthetics on these cut slopes. The woven geotextile will be subjected to tension due to wind uplift.

Due to proximity of the site, the Las Vegas Airport wind speed data was used for this analysis. A design wind speed of 90 mph is used, which is the peak gust recorded since 1961. This is a conservative design wind speed since the likelihood of this wind speed occurring during the period of construction is very low. Assuming the design wind speed, the calculations suggest that the maximum tension the woven geotextile will experience is 82.8 lb/in. In order to resist the uplift forces from wind loads, the woven geotextile shall have a minimum ultimate wide width tensile strength of 110 lb/in. The tension due to wind uplift calculations is presented in Section 2, Calculation Package J of the SRAPI.

3.11 Anchorage Capacity

The geosynthetics' anchor must have the capacity to withstand potential pullout tension due to wind uplift from the UV-protective woven geotextile. The proposed anchor consists of a 2-ft wide and 2.5-ft deep trench filled with compacted soil.

The anchor trench will be overlain by 1 ft of soil with a 3-ft runout length from the top of slope. The capacity of the anchor trench is sufficient to withstand pullout tension from the woven geotextile. The anchorage capacity calculations are presented in Calculation Package K.

3.12 Geocomposite Equivalency Demonstration

A geocomposite layer will be used in lieu of a leachate collection gravel and separation/filtration geotextile. A geocomposite layer, consisting of two 8 oz/yd^2 nonwoven geotextiles bonded to either side of a geonet, is proposed. The top geotextile shall conform to the requirements presented in the geotextile separation/filter calculation package (Section 2, Calculation Package F in the SRAPI). The combined weight of the geotextiles will act as an equivalent cushion. The calculations suggest that a drainage composite will provide equivalent transmissivity to the aggregate drainage layer. The geocomposite equivalency demonstration calculations are presented in Section 2, Calculation Package L of the SRAPI.

3.13 Consolidation Analysis

Consolidation analyses were performed to evaluate the potential affect on the performance of the proposed liner system under increased loads related to the BRC CAMU. Borings and associated laboratory test results were used for locations beneath the South Mesa (higher loads due to thicker waste profile). Conservative analyses suggest that consolidation will not adversely impact the performance of the proposed liner or leachate collection systems. The consolidation analysis for the South Mesa is presented in Section 2, Calculation Package M of the SRAPI.

In addition, a consolidation analysis was performed to evaluate the effects of the consolidation settlement of waste in the “slit trenches” that will be overlain by the North Mesa disposal area. This evaluation was performed prior to the decision to remove the slit trench waste, place the waste in the CAMU, and backfill the excavations to original grade.

The consolidation analysis is presented in Section 2, Calculation Package N of the SRAPI.

Subject: Groundwater Elevations
BRC CAMU
Henderson, Nevada

Dear Dr. Sahu:

In accordance with the Nevada Department of Environmental Protection (NDEP) draft Notice of Deficiency (NOD) dated 13 February 2007, Geosyntec has evaluated the groundwater elevation data associated with the Basic Remediation Company Correction Action Management Unit (CAMU) located in Henderson, Nevada. The proposed CAMU liner system, as illustrated on Drawing J-7, is designed to be a minimum of 5 feet above the groundwater elevation. The groundwater elevations presented on Drawing J-7 were obtained by Montgomery Watson Harza (MWH) in July 2005.

Based on the groundwater contours provided by MWH, the north mesa portion of the CAMU (i.e., the portion over the slit trenches) liner system is greater than approximately 40 feet above groundwater and the south mesa portion of the CAMU liner system (i.e., in the borrow pit area) greater than 5 feet above groundwater. Approximately 93% of the south mesa portion of the CAMU liner system area is more than 10 feet above the groundwater.

The CAMU liner system is designed to limit migration of liquids in the CAMU to the groundwater, which will also limit the migration of groundwater into the CAMU if groundwater were to rise above the base liner system elevation. Furthermore, if groundwater were to rise to an elevation above and migrate through the CAMU liner system, the liquid would be collected in the leachate collection and removal system and would then be removed from the landfill as outlined in the operations plan.

Based on this information, we do not anticipate that rising groundwater levels, if they occur, would adversely impact the performance of the liner system or CAMU.

Sincerely,

Ronald S. Johnson, P.E.
Associate Engineer

1.0 INTRODUCTION

This BRC CAMU Construction Plan summaries the construction requirements and schedule for the base liner system. This section addresses the construction materials, installation, and grading requirements implemented for the BRC CAMU. The rationale for selecting the liner materials is described in the supporting calculations. A Base Liner System Construction Quality Assurance (CQA) plan, base liner system technical specifications, and conceptual drawings are included with the Supplemental RAP Information (SRAPI). The Final BRC CAMU CQA Plan and Technical Specifications are included in SRAPI Sections 9 and 10, respectively. The Final Construction Drawings are included as Attachment P.

Construction of the CAMU was performed by general contractor ENTACT Environmental Services (ENTACT) of Friendswood, Texas. ENTACT's subcontractors included the following:

- American Asphalt and Grading (AAG) performed excavation and fill components of the Phase I cell.
- Environmental Specialties International, Inc (ESI) installed liner, LCRS piping and drainage components, and LCRS and vadose zone monitoring sump liner systems and side slope riser pipes.
- Kenny Surveying provided surveying services to ENTACT for earthworks and liner placement.

Construction was managed by the Construction Manager, Weston Solutions, Inc. (Weston) and BRC. CQA was performed by Geosyntec.

2.0 LINER CONSTRUCTION SCHEDULE AND SEQUENCE

Construction of the CAMU components were phased to increase efficiency of waste disposal. Construction of the six CAMU liner phases is summarized below:

Phase	Start Construction	End Construction
Phase I	7 July 2008	12 September 2008
Phase II	24 July 2008	10 December 2008
Phase IIIA	1 October 2008	7 March 2009
Phase IIIB	16 December 2008	25 May 2009
Phase IV	28 April 2009	22 July 2009
Phase V	21 May 2009	12 September 2009

Each Phase was separated from adjacent phases with storm water controls to reduce surface water, leachate, and waste interaction. The liners in adjacent units were joined using the seaming techniques outlined in the Final Technical Specifications and CQA Plan (Sections 9 and 10 of the SRAPI, respectively). As lined areas were completed with waste placement, they were closed and the final cover system was constructed, as discussed in the CAMU (Landfill) Closure and Post-Closure Plan (Attachment O).

The general construction sequence of the CAMU, as shown on the Final Construction Drawings (Attachment P) is outlined in the following sections.

2.1 Site Preparation

The site was prepared by removing surface vegetation and portions of the fence currently on site. A temporary perimeter fence was established and all support facilities brought on-site. At this time, the haul roads and storm water controls (ditches, culverts, silt fences, check dams, and basins) were constructed. Following completion of Phases I and II, the slit trenches were excavated, waste disposed of within the CAMU, and backfilled. The liner foundation was graded in accordance with the Final Construction Drawings (Attachment P) to prepare for liner installation. The grading requirements are summarized in Section 3 of this Attachment and are shown detail in the Final Construction Drawings (Attachment P).

2.2 Liner Installation

After the liner foundation grading, the leachate collection system and liner installation began. The flowlines, sumps, and berms for leachate conveyance and storage were constructed as shown on the Final Construction Drawings (Attachment P). Liner construction began with the installation of the geosynthetic clay liner (GCL), and geomembrane. Requirements for installation are summarized in Section 3 of this Attachment and in detail in the SRAPI.

2.3 Leachate Collection and Removal System Installation

The LCRS system was installed next, with collection pipes, drainage aggregate, geotextile, and geocomposite. The geocomposite and filter geotextile was overlain with 2 feet of soil-like waste acting as an operations layer. Requirements for the geocomposite and filter geotextile are summarized in Section 3 of this Attachment and in detail in the SRAPI.

3.0 LINER CONSTRUCTION REQUIREMENTS

3.1 General

This section describes the construction requirements for installation of the base liner system at the BRC CAMU. These construction requirements are necessary in order to ensure that the construction of the liner system is consistent with the design performance goals and assumptions.

3.2 Slope Inclinations

Native soil cut slopes were excavated no steeper than a slope inclination of 2.1H:1V. Waste soil slopes were placed no steeper than a slope inclination of 3H:1V.

3.3 Drainage Pipe Size Requirement

In accordance with the analyses performed, the drainage pipe was 4-inch diameter HDPE pipe with either four 1/4-inch perforations per foot of pipe or four 5/8-inch perforations per foot if the pipe was wrapped in 6 ounce per square yard (oz/sy) geotextile. The side slope riser pipes were 12 – and 18-inch diameter HDPE solid-wall pipe for the vadose zone monitoring and leachate collection sumps, respectively. The standard dimension ratio (SDR) for the 4-inch diameter pipe and the 12- and 18-inch side slope risers were less than or equal to 13.5.

3.4 Equipment Loading

Equipment loads were limited to a maximum loading of 10 psi overlying a minimum of 1 ft of operations materials. In addition, roads for haul trucks with a ground pressure greater than 20 psi were a minimum of 2 ft in thickness overlying the liner system.

3.5 Geotextile Requirements

A 6 oz/sy separation/filtration geotextile was used above drainage aggregate around pipes and above the LCRS sump. A UV protective geotextile was used on the exposed liner system components on the side slopes. To ensure proper manufacturing and durability, the 6 oz/yd^2 separation/filter geotextile had the following properties:

Matrix	Nonwoven
Mass per Unit Area	$\geq$ 6 oz/yd^2

Apparent Opening	≤0.21mm
Permittivity	≥ 0.6 sec-1
Grab Strength	≥ 130 lb
Puncture Strength	≥ 40 lb
Ultraviolet strength retention	≥ 70%

The nonwoven, separation/filtration geotextile installed was SKAPS GT-160.

The UV protective layer woven geotextile had the following properties:

Matrix	woven
Wide Width Tensile Strength	≥ 110 lb/in (ultimate strength)
Apparent Opening	≤ 0.43mm

The UV protective layer woven geotextile installed was SKAPS W315.

3.6 Geosynthetic Clay Liner (GCL)

The GCL component of the base liner system had the following properties:

- Index flux > 1.0×10^{-8} m^3/m^2-sec;
- Minimum interface shear strength of 12 degrees;
- The GCL was dry during installation; and
- combined geotextile mass per unit area of 9 oz/yd^2.

The GCL installed was CETCO Bentomat® DN.

3.7 Leachate Collection Layer

3.7.1 Geocomposite Requirements

In lieu of using drainage aggregate, a geocomposite was used to collect potential leachate. The selected geocomposite had the following properties:

- Transmissivity > 9.2 x 10^{-5} ft^2/sec under a confining pressure of 12,000 psf and a hydraulic gradient of 0.10;
- an 8 oz/yd^2 non-woven geotextile bonded to each side of the geonet; and
- the top 8 oz./yd^2 non-woven geotextile had an AOS greater than 0.21mm, permittivity greater than 0.6 sec-1, and sufficient mechanical properties.

The geocomposite installed was SKAPS 240-2-8.

3.7.2 Geomembrane Requirements

The geomembrane was high-density polyethylene (HDPE), had a nominal thickness of 60 mils, and was textured on both sides. The geomembrane installed was 60-mil Agru Microspike™.

3.8 Prepared Subgrade Requirements

The prepared subgrade had a maximum exposed particle diameter less than 3/4 inch.

4.0 RECORDS AND RECORDKEEPING

4.1 General

Liner and Leachate Collection System construction records were kept in accordance with the CQA plan. Geosyntec, the CQA consultant, documented that quality assurance requirements were addressed and satisfied.

Geosyntec provided BRC with signed descriptive remarks, data sheets, and logs to document that monitoring activities had been carried out. Geosyntec also maintained, at the job site, a complete file of Drawings and Technical Specifications, a CQA Plan, checklists, test procedures, daily logs, and other pertinent documents.

4.2 Daily Recordkeeping

Preparation of daily CQA documentation consisted of daily reports prepared by the Geosyntec which included CQA monitoring logs, and testing data sheets.

Geosyntec and Weston prepared daily reports that documented the activities observed during each day of activity. The daily reports referenced monitoring logs and testing data sheets. At a minimum, these logs and data sheets included the following information:

- the date, project name, location, and other identification;
- a summary of the weather conditions;
- a summary of locations where construction is occurring;
- equipment and personnel on the project;
- a summary of meetings held and attendees;
- a description of materials used and references of results of testing and documentation;
- identification of deficient work and materials;
- results of re-testing corrected "deficient work;"
- an identifying sheet number for cross referencing and document control;
- descriptions and locations of construction inspected;
- type of construction and inspection performed;
- description of construction procedures and procedures used to evaluate construction;
- a summary of test data and results;
- calibrations or re-calibrations of test equipment and actions taken as a result of re-calibration;
- decisions made regarding acceptance of units of work and/or corrective actions to be taken in instances of substandard testing results;
- a discussion of agreements made between the interested parties which may have affect the work; and
- signature of the respective CQA Site Manager.

4.3 Requests for Information

Requests for information (RFIs) were submitted by ENTACT to Weston and BRC describing special construction situations which were not identified in the Construction Drawings and/or Technical Specifications. In some cases, solutions to the problems arising from the special construction situations were presented by ENTACT. BRC, Weston, and/or the Engineer-of-Record (EOR), Geosyntec or ATKINS, would address the RFI and, if necessary, issue a design change notification (DCN) to address

changes to the Construction Drawings and/or Technical Specifications. Applicable RFIs were included in the CQA Report.

4.4 Photographic Documentation

Photographs were taken and documented in order to serve as a pictorial record of work progress, problems, and mitigation activities. Photo logs were included in the CQA Reports.

4.5 Design Changes

Design changes were required during construction. The design change notification (DCN) was prepared by Geosyntec and reviewed and approved by BRC and NDEP. The DCNs took the form of an addendum to the Drawings and Technical Specifications. Design changes were included in the CQA Reports (SRAPI Sections 11 through 19).

4.6 CQA Report

At the completion of each phase, Geosyntec submitted to NDEP the CQA report signed and sealed by a Professional Engineer licensed in the State of Nevada. The CQA report acknowledged: (i) that the work had been performed in compliance with the Drawings and Technical Specifications; (ii) physical sampling and testing had been conducted at the appropriate frequencies; and (iii) that the summary document provided the necessary supporting information.

Record drawings were included in the CQA Reports which depicted the location of the construction and details pertaining to the extent of construction (e.g., depths, plan dimensions, elevations, soil component thicknesses). Base maps required for development of the record drawings and the record drawings themselves were prepared by a qualified Professional Land Surveyor registered in the State of Nevada.

Below is a list of the CQA Reports submitted and approved by NDEP for the liner construction:

Phase	CQA Report	Location in RAP
Phase I	Phase I Construction Quality Assurance Report, Basic Remediation Company Corrective Action Management Unit dated September 2008.	SRAPI Section 11
Phase II	Phase II Construction Quality Assurance	SRAPI Section 12

Phase	CQA Report	Location in RAP
	Report, Basic Remediation Company Corrective Action Management Unit dated December 2008.	
Phase IIIA	Phase IIIA Construction Quality Assurance Report, Basic Remediation Company Corrective Action Management Unit dated March 2009.	SRAPI Section 13
Phase IIIB	Phase IIIB Construction Quality Assurance Report, Basic Remediation Company Corrective Action Management Unit dated May 2009.	SRAPI Section 14
Phase IV	Phase IV Construction Quality Assurance Report, Basic Remediation Company Corrective Action Management Unit dated July 2009.	SRAPI Section 15
Phase V	Phase V Construction Quality Assurance Report, Basic Remediation Company Corrective Action Management Unit dated September 2009.	SRAPI Section 16

The CQA Reports will be kept with the project records in accordance with the records retention requirement of the AOC3.

1.0 INTRODUCTION

The purpose of this Operation Plan is to delineate the procedures and operating practices that were implemented to ensure the safe and efficient excavation, loading, transportation, receipt, and placement of remediation wastes at the BRC CAMU. This Operation Plan summarizes operational procedures that were implemented during placement of waste in the BRC CAMU.

2.0 FACILITIES

2.1 Equipment

The equipment used at the BRC CAMU was documented in the Weston Daily reports. Equipment included, but was not limited to, the following:

- Excavators;
- On- and Off-Road Haul Trucks;
- Scrapers;
- Graders;
- Dozers;
- Water Trucks;
- Forklifts;
- Skidsteers; and
- Rollers.

Equipment used was dependent on the following factors:

- Amount and type of waste to be handled;
- Weather conditions;
- Compaction requirements;
- Site and soil conditions (topography, soil moisture, and difficulty of excavation); and
- Supplemental tasks such as maintaining roads, assisting in vehicle unloading, and moving other materials and equipment around the site.

2.2 Operation Support

ENTACT's and Weston's support facilities were provided near the eastside operations. Trailers and sanitary facilities were provided for site personnel. Additional sanitary facilities were provided at the BRC CAMU. Material storage at the BRC CAMU

was generally north of the North BMI Landfill; however, other areas were utilized as needed throughout the Site.

2.3 Access, Traffic Control, and Roads

Site access was gained through the entry gate located off Warm Springs Road on the east end of the north side of the property. Access was controlled fencing during site operations in order to prevent unauthorized vehicular traffic and illegal dumping. The entry gate was equipped with a lock when not in operation and a security guard was present at the entrance to prevent unauthorized entry and/or uncontrolled waste deposition. Access to the site at points other than the entry gate was discouraged by maintenance of site perimeter fencing and full time security during site operations.

Temporary roads were provided as necessary to the working face. All roads were passable during inclement weather.

2.4 Signs

At the main entrance gate off West Warm Springs Road, a sign was posted indicating the following:

- Facility name;
- The owner and operator of the site;
- The hours of operation; and
- Materials accepted or excluded.

It was noted on the signage that the BRC CAMU was a private operation.

Instructional signs were placed at this site entrance addressing prescribed safety measures on the site and include instructions regarding prohibition of smoking within the disposal areas and mandating that all instruction from site personnel be obeyed.

Interior site haul roads were appropriately signed so as to direct each load to its designated disposal area. Typical directional and information signs were posted at the site. Location of signage was changed from time-to-time to facilitate operations. In addition, authorized personnel were utilized to direct traffic at the active working face of the landfill operation.

"No Trespassing" signs were posted at 100-foot intervals along the site perimeter fencing. "Danger- Unauthorized Personnel Keep Out," were posted at each

entrance to the active portion of the BRC CAMU and additional locations as necessary. All signs were posted in English and Spanish.

Additional signs and/or measures were posted, as required, to protect personnel and public health and safety.

3.0 OPERATING CRITERIA

This section presents operating criteria of the BRC CAMU and methodologies used to meet such criteria.

3.1 Health and Safety

All activities were performed in accordance with ENTACT's Health and Safety Plan (HASP) developed for Site remediation. ENTACT's HASP applied to their employees and subcontractors. The HASP included the following:

- Identification of chemical and physical hazards associated with the remediation activities;
- Minimum training requirements for site workers;
- Minimum Personal Protective Equipment (PPE) for site workers and visitors and criteria for upgrades;
- Air monitoring requirements for workers' breathing zone and site perimeter (for public protection);
- Emergency information, such as emergency telephone numbers and directions to the nearest hospital; and

Administrative requirements, such as documentation of training, daily health and safety tailgate meetings, and documentation of air monitoring.

3.2 Fire Prevention

Fire hazard at the BRC CAMU was minimal due to the type of material being landfilled. Explosive gases (e.g. methane) were not anticipated at the BRC CAMU because putrescible material was not accepted at the BRC CAMU for disposal. The amount of vegetation disposed of in the CAMU was minimal and presented a very low risk for the generation of significant amounts of methane.

No open burning of wastes was allowed at the site. Fire control protection, as necessary, was provided by the utilization of on-site equipment such as a water truck, track type dozer and front-end loaders for wetting and smothering accidental fires. In addition, site-related operational vehicles were equipped with fully functional fire

extinguishers. Backup fire protection was available from units of the Clark County Fire Department.

Site personnel received periodic on-the-job training in firefighting practices conducted by BRC and/or other authorized representatives.

During slit trench excavation, pyrophoric materials were exposed. Fires resulting from exposure of this material were allowed to burn out as initially observed by the Clark County Fire Department.

3.3 Control of Windblown Material

Scattering of papers, plastic, or other debris by the wind occurred minimally during Slit Trench excavation. BRC and ENTACT used litter fences and hand labor to control windblown waste materials.

Dust control measures were implemented to limit the amounts of wind-blown dust. Dust control was accomplished via moisture management and synthetic covers, as required. Operations ceased during periods of high winds, consistent with Clark County requirements as in ENTACT's Dust Control Permit and Mitigation Plan submitted with the Phase I CQA Report (Geosyntec, 2008).

3.4 Special Waste Disposal

The Eastside Common Areas waste consisted of residual soil remaining from industrial process fluid settlement in evaporation ponds. In addition, solid waste from the Slit Trench excavations were placed in the BRC CAMU. Woven geotextile removed from side slopes was sized in accordance with the Final Technical Specifications (SRAPI, Section 9) and disposed of in the CAMU. Disposal of vegetation is discussed in Section 3.8, below. No other special wastes were accepted.

3.5 Control of Authorized and Unauthorized Waste

The source materials for the BRC CAMU included the residual solids (i.e., sediments and associated soils) from the industrial ponds, ditches, and related source areas, and slit trench waste from the BRC CAMU area. Municipal wastes was not accepted from private individuals. Unlike typical landfills, both the source material and the BRC CAMU were under sole control of BRC. Consequently, there was control over the types of waste materials accepted at the BRC CAMU.

3.6 Disposal of Liquids

Liquids, other than leachate used for dust control over the landfilled waste materials, were not disposed of at the BRC CAMU.

3.7 Control of Explosive Gas

Due to the nature of material to be placed in the landfill, evidence of the generation of methane or other explosive gases was not identified. Controls for explosive gas were not required.

3.8 Disposal of Vegetation

Vegetation was removed from excavation areas and access routes. Soil attached to plant roots was shaken loose and collected with the other soils in that excavation area. The vegetation was sized in accordance with the requirements in the Technical Specifications and disposed of in the CAMU.

3.9 Compliance with State Implementation Plan

BRC ensured that the BRC CAMU did not violate applicable requirements developed by the state implementation plan, if any, approved or adopted by the Administrator of the USEPA, pursuant to Section 110 of the Federal Clean Air Act, as amended (42 U.S.C. § 7410), and the regulations adopted pursuant thereto. As noted earlier, dust mitigation was ensured by adherence to the Dust Mitigation Plan. In addition, there will be no open burning of solid wastes at the BRC CAMU.

3.10 Putrescible Wastes and Vector Control

Due to the nature of majority of the waste material placed in the BRC CAMU, putrescible wastes and vector control issues did not apply.

3.11 Nuisance Control

The operation and maintenance of the BRC CAMU was in a manner which did not create odors, unsightliness or other nuisances. Ponded water was removed and used as dust control; thus this source of obnoxious odors and vector breeding was obviated. Litter screens were used when Slit Trench waste materials containing paper and other wind susceptible waste materials were placed within the CAMU.

3.12 Waste Acceptance

Waste acceptance criteria is outlined in the Technical Specifications (SRAPI, Section 9). Accepted waste included the following:

- Eastside contaminated material:
  - Eastside Sludge Material; and
  - Eastside Dry Pond Material.
- Slit Trench Contaminated Material;
- Western Ditch Material;
- CAMU Impacted Material;
- Eastside Debris;
- Vegetation; and
- Woven CAMU geotextile removed from side slopes.

Geosyntec evaluated the Eastside Sludge Materials' properties through laboratory testing and identified criteria for sludge material acceptance in the CAMU to minimize leachate generation. The laboratory testing was summarized in the Waste Processing and Placement Plan (WPPP, Attachment AD). The acceptance criteria for processed waste was added to the Technical Specifications (SRAPI, Section 9). Testing frequency was incorporated into the CQA Plan (SRAPI, Section 10). Waste not meeting the 83 percent solids criteria could be dried and/or mixed more to increase the percent solids or could undergo one dimensional rapid compression testing to demonstrate no liquid would be squeezed out from the specimen.

3.13 Waste Processing

Eastside sludge materials were mixed with Eastside Dry Pond material and/or dried to increase the percent solid of the material prior to placement. Oversized Eastside and Slit Trench waste/debris were reduced in size. Vegetation was chipped and mixed with Eastside contaminated material at a rate of 1 to 1. Waste processing requirements are described in the Technical Specifications (SCRAPI, Section 9).

3.14 Waste Placement

Waste was placed in 12-inch horizontal lifts with a top surface graded no flatter than a 3 percent slope and side slopes no steeper than 3 horizontal to 1 vertical (3H:1V). Processed debris was spaced specific distances from the bottom, side, and cover liners. Daily cover consisted of eastside (waste) materials placed 6-inches thick over exposed Slit Trench contaminated materials only; daily cover was not placed over Eastside contaminated materials. Processed vegetation was placed in 12-inch lifts and separated by a minimum of 12 inches of Eastside material so that consecutive lifts of vegetation were not placed.

Eastside dry and dried sludge materials were compacted with a minimum of 3 passes of a compactor operating in vibratory mode with a weight exceeding 20,000 lbs. The compacted surface was proof-rolled with a loaded CAT 740 dump truck or full water truck for signs of rutting. Waste material exhibiting more than 1-inch of rutting was only accepted if texture and/or other field parameters indicated maximum compaction had been achieved. Waste placement and compaction was tracked by Geosyntec in accordance with the Final CQA Plan (SRAPI, Section 10).

One foot of non-impacted, 1-inch minus soil was placed above the final waste grades as interim cover. Interim cover provided a non-impacted surface for ESI to install liner on as well as minimized stormwater contact with waste materials prior to cover installation.

Horizontal and vertical control was necessary to ensure that the final grades and cell geometry are constructed as planned. The BRC CAMU was filled to within three feet of the required final elevation. Equipment used for grading had GPS controls allowing for accurate waste placement.

Waste placement criteria is provided in the WPPP and Technical Specifications (Attachment AD and SRAPI, Section 9, respectively).

3.15 Miscellaneous Requirements for Operation

Scavenging through waste at the working face of the BRC CAMU by citizens or non-employees of the landfill operations staff was prohibited and did not occur. The working face area was inspected daily and lightweight debris that was wind blown away from the working face was returned to the fill area and covered. The locations of the Slit Trench Materials were surveyed and included with the as-built drawings. Topographic waste surveys were performed monthly to double-check and further quantify the volume of materials placed within the BRC CAMU.

3.16 Control of Erosion, Mud and Dust

Dust was controlled using water and, when available, stormwater (non-impacted areas) and leachate (waste areas). Sufficient water was available during construction for dust control.

Adequate measures were taken to minimize the creation of dust and minimize safety hazards due to obscured visibility. Roadways were sprayed with water.

Primary interior roadways were surfaced with 1-inch of cap rock to minimize dust generation. Ramps and unloading areas at designated interior disposal areas will be graded for proper drainage with earth-moving and grading equipment.

During periods of wet weather, such surfacing and maintenance practices were eliminated, or at least minimized to reduce the tracking of mud off-site. ENTACT was responsible for a daily inspection of the main incoming road and sweeping of West Warm Springs Road during hauling. In addition, temporary shaker plates and rock track out pads were installed to minimize tracking of mud off site. Accumulated mud deposits remaining on interior haul road surfaces were similarly removed as needed by light grading to control dust emissions resulting from normal traffic.

3.17 Run-on and Runoff Control Systems

The stormwater management system was designed by ATKINS (Originally PBS&J). The run-on system collected flow and routed it around the BRC CAMU. The stormwater management design is included in Attachment P-2.

During waste placement activities, runoff from the active portion of the BRC CAMU was directed to open phases and/or low points within the waste. Impacted water which accumulated was used for dust control on waste material. Stormwater was managed so as to not cause a discharge of pollutants, silts, or a nonpoint source of pollution from the BRC CAMU into the waters of the state or waters of the United States, including wetlands. Surface water runoff throughout the active portion of the site was managed to minimize contact of water with solid waste.

Surface water runoff from the site and surrounding areas is managed through a series of permanent perimeter drainage channels (Attachment P-2). Runoff accumulates in one of two stormwater retention ponds at the northeast and northwest corners of the CAMU. Natural drainage patterns or discharge quantities associated with the site and surrounding areas were not significantly altered. Runoff was periodically sampled and tested for general compliance with Nevada National Pollution Discharge Elimination System (NPDES) permit standards.

3.18 Leachate

During waste placement activities, the leachate was removed from the sumps using permanent submersible pumps. Leachate was used for dust control on waste materials placed within the lined limits of the BRC CAMU. Leachate levels were monitored in accordance with the Final Leachate Monitoring Plan (Attachment Z-1).

3.19 Decontamination

ENTACT prepared and implemented a Decontamination Plan. Personal decontamination was performed at stations between the work exclusion and support zones. The following steps from start to finish were identified for Levels D, B, and C PPE:

Decontamination Step:	Level D/D+	Level C/B
Equipment Drop	X	X
Outer Boot and Glove Wash and Removal	X	X
Protective Clothing Removal	X (Level D+ only)	X
Respirator Removal		X
Inner Glove Removal	X	X
Field Wash	X	X

All disposable, spent PPE was removed and properly disposed of offsite.

Equipment was decontaminated as it left the exclusion zone and entered the public roadway. Equipment was visually inspected and underwent gross (if necessary) and fine decontamination. Gross decontamination removed soil/waste within the exclusion zone using shovels, scrapers, brooms, etc. in order to minimize the amount of impacted material from entering the contamination reduction zone. Fine decontamination occurred on concrete-lined decontamination pads which employed high pressure, low volume nozzles to remove impacted materials. Decontamination water was removed and used as dust control water and/or evaporated.

4.0 REMEDIATION

This section summarizes the excavation procedures, the methods for transporting soils to the BRC CAMU, and documentation which are discussed in detail in the CAP. The BRC CAMU was sized to contain approximately 3.7 million cubic yards of material.

4.1 Eastside Sludge Material Drying

Extremely saturated sediments in the 16 wet ponds were dried through a combination of dewatering, discing, and mixing of dry materials. A dewatering trench was excavated around the perimeter of the ponds which drained to a sump. Water collecting in the sump was pumped and evaporated within an existing dry pond.

Sediments were excavated and relocated to drying areas established over existing dry ponds. The sediments were placed in 6 to 9 inch lifts and left to dry. After

approximately 1 week, sediments were disced to break up the dry sediment and increase the surface area for drying. After a few more days, a larger disc was used to break up the sediment again and mix the sediment with the underlying dry/sandy material.

In-situ mixing was also utilized by hauling Eastside Dry Material to a wet pond (or vice versa). Mixing was initially started using a excavator bucket. Once the material began to solidify, a dozer/disc combination was used to further mix the materials together, if necessary.

4.2 Soil Excavation

ENTACT used excavators for most of the Eastside excavation activities; however, scrapers were used for some dry soil excavations. Eastside Dry Materials were generally direct loaded into trucks and transported to the CAMU. Excavation progressed incrementally from west to east.

Western Ditch soils were excavated from east to west and processed to remove over-sized particles. Processed material was then relocated and placed within Phase I as Operations Layer. The remaining Western Ditch material, along with the over-sized particles screened out of the Western Ditch material used for Operations Layer in Phase I, was hauled to Phase I as waste for placement above the Operations Layer.

The Slit Trenches were excavated following construction and approval of Phase II. Sheet piles were installed around the outside of several of the trenches adjacent to the South BMI Landfill and property lines, which allowed excavation without significant sloping the excavation side walls in these areas. Slit Trench excavation was performed in Level B PPE and the route between the Slit Trenches and Phase II disposal area was designated as an exclusion zone. A CAT 345 excavator with GPS control was used to excavate the trenches in a clockwise manner. No more than 40,000 square feet of trench was open at one time to minimize potential odors. Trenches were backfilled following visual confirmation of waste removal by Geosyntec.

4.3 Soil Transportation to BRC CAMU

Materials were initially transported to the CAMU using a fleet of 40 ton, articulated off-road haul trucks. Hauling operations were performed at night to minimize disturbance to traffic on West Warm Springs Road. Vehicles entered the restricted site areas from West Warm Springs Road and traveled west approximately 2,500 ft until turning south into the CAMU. Following removal of a majority of the waste, materials were hauled using a fleet of over-the-road dump trucks and hauling operations occurred during daytime hours.

Spillage of soils from trucks during transportation was minimized by not overloading the transport vehicles, by grading smooth haul roads, and by employing trucks with enclosed or covered cargo bays. Dust was controlled by water in accordance with the Dust Control and Mitigation Plan. Vehicles were decontaminated prior to exiting the Eastside and CAMU areas. In addition, a street sweeper was in constant operation on West Warm Springs Road during hauling operations.

There were no accidents resulting in the release of materials being transported.

4.4 Soil Placement

Waste was placed in accordance with Section 3.14.

5.0 REPORTING AND RECORDKEEPING

5.1 General

Weston prepared daily progress reports documenting all daily activities. Daily activity records included, but were not limited to, documentation that evidences the quantity of waste materials placed in the BRC CAMU and log in/out forms. In addition to Weston's summary daily report, the ENTACT and Geosyntec also kept detailed field notes and daily logs. Daily photographic and video records were kept by BRC documenting all remediation activities. Records and results of daily, weekly, and monthly inspections will be maintained and kept at BRC's offices consistent with requirements specified in the AOC3.

Records and results of waste analysis and waste determinations were maintained and are kept at BRC's offices. In addition, all monitoring, testing or analytical data, and corrective action records resulting from BRC CAMU releases are maintained at BRC's offices onsite consistent with requirements specified in the AOC3. Groundwater monitoring and clean up records were maintained until closure.

Summary reports of all incidents that required the use of the Contingency Plan contained the details outlined in Attachment G, Accident Prevention, Contingency, and Emergency Response Plan. The incident reports were maintained and kept at BRC's offices until closure of the BRC CAMU.

Additional items that were included with the operating records were: closure and post-closure cost estimates, plans for closure and post-closure, EPA identification number, detailed chemical and physical analysis of a representative waste sample, Quality Control (QC) and Quality Assurance (QA) documentation.

5.2 Interim Status Reports

During remediation activities at the Site, BRC submitted weekly and monthly status reports to the NDEP. In addition, weekly status calls were held with NDEP to discuss activities occurring during the previous week and upcoming activities. Weekly status reports kept NDEP informed of Site operations, submittals, design changes, requests for information, and waste testing progress. The monthly status reports kept NDEP informed of the progress of remedial activities at the Site. The reports presented a summary of the remediation progress during the previous month, including as appropriate:

- Significant milestones in CAMU construction;
- Pond and ditch locations where excavation was completed (including graphical format);
- Pond and ditch locations where special control measures (except dust control, which is routine measure) were necessary and/or where excavation had to be prematurely terminated; and
- Estimates of volumes of soil excavated and placed in the CAMU (monthly and cumulative). Other information (e.g., discovery of significant environmental conditions previously unidentified) were provided in the monthly status reports as warranted.

Other information (e.g., discovery of significant environmental conditions previously unidentified) was provided in the weekly call or monthly status reports as warranted or otherwise required by the AOC3.

Appendix A – Inspection Forms

1.0 INTRODUCTION

This BRC CAMU Monitoring Plan describes the procedures and activities that BRC undertook and will undertake to detect and subsequently characterize releases of wastes or hazardous constituents to groundwater that occurred or may occur from areas of the BRC CAMU during operation and after closure.

2.0 CONSTRUCTION MONITORING

2.1 Surface water

BRC carefully maintained drainage to expedite storm water collection. A portable pump was provided at the low end of the BRC CAMU to remove accumulated storm water. After the leachate pumps were installed, some stormwater was removed utilizing the leachate pumps while surficial storm water was removed usin the sump pumps. The operator maintained access to these pumps and maintained the pumps in good working condition with a good supply of fuel and suction hoses in position for water removal at all appropriate times.

During operating hours, the operator pumped water from the working cell as quickly as possible whenever it accumulated. When heavy rainfalls occurred during non-operating hours, standing water was be pumped out before normal operations resumed.

Surface water exiting the site from the on-site storm water basin was periodically sampled and tested for general compliance with Nevada surface water standards for the Las Vegas Wash. BRC obtained necessary NPDES permits from the NDEP prior to discharge of such waters.

2.2 Leachate

The BRC CAMU was managed to reduce the generation of leachate from waste. However, leachate accumulated in the leachate collection sumps as a result of stormwater infiltration along exposed side slope liner and uncovered base liner areas. The base grade of the BRC CAMU was designed so that leachate accumulated at the designated leachate collection points, or sumps. ENTACT monitored the leachate level and removed and disposed of the leachate, as needed, consistent with the Final Leachate Monitoring Plan (Attachment Z-1). During active waste placement, leachate collected from the sumps was used for dust control and waste material moisture conditioning purposes over the lined areas only.

In addition, vadose zone monitoring sumps, were installed beneath each of the sump areas of the BRC CAMU to monitor for possible leakage from the liner system at the locations of the lowest elevations in the liner system (sumps), which is where leachate accumulated. Following rain events in February 2009, leachate was discovered in the Phase I and II LCRS sumps and liquid was detected in the Phase I vadose zone sump. The Phase II vadose zone sump did not have any detectable liquid present. NDEP requested a Leachate Management Plan as a result of the discovery of leachate in the leachate collection and recovery system (LCRS) sump in Phases I and II and vadose zone monitoring sump in Phase I. The vadose zone monitoring sumps will be monitored in accordance with the Post-Closure Leachate Monitoring Plan (Attachment Z-2).

2.3 Air Monitoring

Based on prior air monitoring results, use of dust control measures minimized the creation of off-site dust migration above relevant regulatory thresholds.

3.0 POST CLOSURE

3.1 General

Formal periodic inspections will be performed using site walks. These site walks will be performed within one week of significant precipitation events (e.g., greater than ¼ inch of rain during a 24-hour period) that could potentially impact either the surface water drainage system or the BRC CAMU cover. At a minimum, a site-wide inspection will be performed at least bi-annually.

The condition of the facility will be documented with field notes, maps, and photographs, as appropriate. Evidence of potential compromises in the cover will be recorded including eroded patches, animal burrows, subsidence, and cracks along the cover. Surface water drainage features will be inspected for the presence of debris, physical integrity, and evidence of conditions that are different from design assumptions. The post-storm and site-wide inspection forms are included as Appendix A.

3.2 Final Cover

Final cover performance will be evaluated through a monitoring program of the final cover and periodic groundwater monitoring. The basis for this strategy is the fact that the final cover will be the critical element to reduce moisture infiltration into the BRC CAMU. Therefore, it is proposed that monitoring efforts be focused on direct observation, measurement, and analysis of the performance of the final cover.

The final cover system shall be periodically monitored in order to evaluate the performance of the final cover. The final cover monitoring plan consists of:

- visual inspection of the final cover system performed on a semi-annual basis and after all major precipitation events; and
- if erosion has occurred, ascertain damage to the geosynthetics, if any, and repair as necessary in accordance with the Technical Specifications and CQA Plan.

The decorative rock cover will be visually inspected for signs of erosion. Areas of erosion will be repaired as needed.

A solar field is planned for installation on top of the final cover. Additional discussion is provided in Section 3.0 of the application.

3.3 Leachate

The leachate collection system will be monitored in accordance with the Post-Closure Leachate Monitoring Plan (Attachment Z-2).

The vadose zone monitoring sumps will be monitored at the same time as the leachate sumps in accordance with the Post-Closure Leachate Monitoring Plan (Attachment Z-2).

3.4 Settlement

Topographic surveys using 1-foot contour intervals were performed at the completion of each closure phase. These surveys document baseline conditions in support of post-closure settlement evaluations. Although settlement is not expected to be a significant issue, this will provide a convenient mechanism to document the surface elevation. Excessive settlement can lead to depressions and ponding causing stress in the infiltration layer. When depressions are identified through the survey, they will immediately be filled with the appropriate cover material.

3.5 Groundwater

The groundwater at the site ranges from 30 to 60 feet bgs, as discussed in the Draft CAMU Area Conceptual Site Model (DBS&A, 2006). At a minimum, the BRC CAMU base liner is approximately 5 feet above the groundwater. Constituent release to the groundwater from the BRC CAMU, post-closure, is considered unlikely for the following reasons:

- The BRC CAMU did not receive liquid waste or waste containing free liquids;
- Waste materials within the BRC CAMU are relatively immobile;
- The BRC CAMU was designed and operated to reduce liquid, precipitation, and other run-on and run-off; and
- The BRC CAMU contains both a base liner system, with a leachate collection and removal system, and final cover system.

It should be noted that releases, if any, into the upper aquifer are difficult to monitor because of the impaired quality of the existing groundwater beneath the BRC CAMU. Most or all of the same constituents that are present in the BRC CAMU are currently present in groundwater at the site. Constituents present in upgradient groundwater make differentiating potential releases from the BRC CAMU difficult or impossible. BRC has completed a set of four semi-annual baseline groundwater monitoring events. Based on this monitoring, a long term groundwater monitoring plan is in development. When approved, BRC will conduct long term groundwater monitoring in accordance with this plan. (see Attachment Y).

4.0 REPORTING AND RECORDKEEPING

Monitoring results will be maintained by BRC in accordance with the provisions of the AOC3 following closure of the CAMU. Monitoring results will be summarized and submitted to NDEP with the annual post-closure report of inspection and monitoring activities.

1.0 INTRODUCTION

This section of the permit application addresses the closure of the BRC CAMU, South BMI Landfill, and North BMI Landfill (collectively, the landfills). This Closure Plan addresses pertinent regulatory requirements, including a description of the final cover. For purposes of this permit application, the Closure Plan addresses activities that will occur when waste placement activities are complete.

Access to the landfills is controlled during the closure phase using procedures employed during the liner construction and waste placement operations. Fugitive dust control measures were maintained and traffic management procedures continued. Site aesthetics continued to be an important element during this phase. Community outreach programs were continued as part of the overall remediation effort (as discussed in the Community Involvement Plan) to address public concerns and issues associated with the landfills.

1.1 Notice of Intent to Close

At least 60 days before beginning the closure of the landfills, the NDEP was notified in writing of the intent to close. Landfill closure activities began no later than 30 days after the date on which the final receipt of wastes occurred.

All closure activities were completed in accordance with this CAMU Closure Plan within 180 days after the beginning of the closure.

1.2 Construction Schedule and Sequence

Landfill closure began with interim cover placement and concluded with completion of 2-feet of cover soil and rock mulch installation. The CAMU was closed in four phases:

Phases	Closure Start Date	Closure End Date
Phase IIIA	12 May 2009	19 April 2010
Phases I, II, IIIB, and IV	7 July 2009	6 May 2010
Phase V – I	20 January 2014	10 April 2014
Phase V – II	2 December 2014	12 January 2015
South BMI Landfill	11 May 2009	15 May 2010
North BMI Landfill - I	20 November 2008	28 April 2010
North BMI Landfill - II	11 February 2014	29 December 2014

The details of closure are provided below.

1.2.1 Final Waste Placement

After waste reached final grades, interim cover was placed over the waste. If waste was left without the final cover for longer than 30 days, the interim cover layer was placed and compacted on top of the waste layer.

1.2.2 Infiltration Layer Construction

The infiltration layer was placed beginning with the geosynthetic clay liner (GCL) above the interim cover. The geomembrane was placed above the GCL with the geocomposite placed last. Details of each layer are discussed in later sections.

1.2.3 Final Cover Construction

The soil materials for the final cover were placed, compacted, and graded. The permanent storm drain facilities (gutters, ditches, culverts, headwalls, etc.) were installed as the cover was completed.

2.0 FINAL COVER COMPONENTS

The final cover is designed to minimize infiltration and erosion. A final cover that reduces infiltration was an essential component in the overall design strategy for the landfills. This, combined with adequate moisture control of the wastes prior to placement, should minimize leachate generation.

Specific design objectives of the final cover system include:

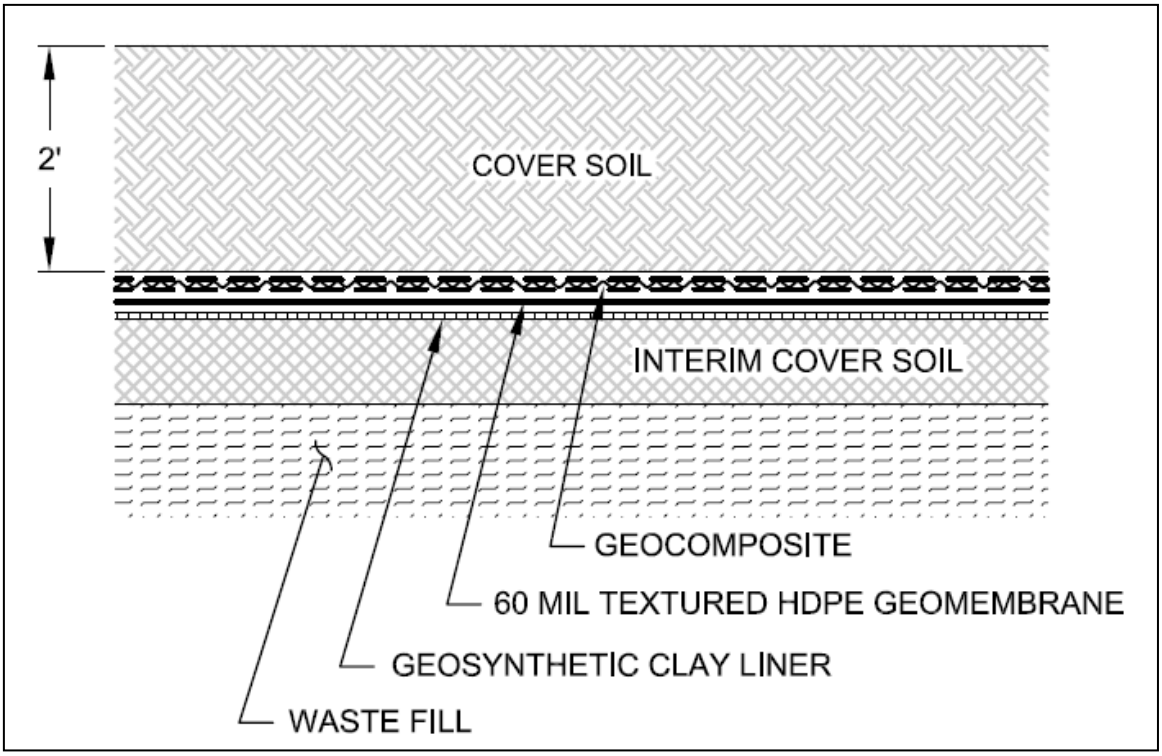
- Minimize infiltration of precipitation into the waste;
- Promote good surface drainage;
- Resist erosion by rain and wind;
- Protect human health and the environment;
- Improve aesthetics;
- Reduce long-term maintenance; and
- Be consistent with land use.

Several of these objectives are directly related to regulatory requirements while the others represent design considerations.

Infiltration through the final cover will be minimized through:

- Design of adequate surface drainage and runoff with minimal erosion; and
- Design of composite barrier system (HDPE geomembrane over GCL) with an overlying drainage layer (geocomposite) to minimize hydrostatic head build-up on the geomembrane.

The final cover will consist of a separate infiltration and erosion layer. Engineering design calculations and construction specifications for the final cover system are presented within Sections 5, 6, and 7 of the Supplemental RAP Information (SRAPI). The final Construction Specifications are provided in Section 9 of the SRAPI. A cross section of the Final Cover System is shown in Detail O-1 below with an explanation of the components explained in the following sections.



DETAIL O- 1, FINAL COVER SYSTEM

2.1 Infiltration Layer

40 CFR 264.310 specifies that the final cover be designed and constructed to have a permeability less than or equal to the permeability of any bottom liner system. The final cover system mimics the CAMU base liner with a drainage geocomposite thicker than the LCRS geocomposite acting as the drainage layer. There is no bottom liner for either the North or South BMI Landfills.

The cover materials were evaluated for minimum strength requirements to reduce the potential for failure, such as sliding between cover layers or within the waste, as described below. The materials were tested as part of the Construction Quality Assurance (CQA) Plan to demonstrate minimum strength criteria were achieved.

Settlement of the CAMU is not expected to be a significant issue given the nature of the waste material and the manner of its placement (i.e. well compacted). Excessive settlement and subsidence at MSW landfills, caused by decomposition and consolidation of the wastes, can impair the integrity of the final cover system. Specifically, it can contribute to ponding of surface water on the cover and fracturing of the low-permeability layers of the cover. However, because the source materials for this BRC CAMU consist primarily of soil materials, the waste placement will be fairly homogeneous with little potential for significant differential settlement. Moreover, the soils were compacted after placement.

Settlement of the North and South BMI landfills (BMI Landfills) is not anticipated to be significant. The BMI Landfills consist of relatively inert waste and the overlying loads associated with the cover system are minimal. Settlement of the landfill likely occurred during construction as a result of equipment loading which was greater than long-term cover loading.

The methods, procedures, and processes used to install the final cover system were consistent with standard industry practices. Initial, conceptual design documents and construction specifications were included in Section 7 of the SRAPI. Those were replaced by the detailed, final design documents which are included in Section 9 of the SRAPI. Procedures for demonstrating the final cover was constructed in accordance with the final design documents are described in the CQA Plan. The initial, conceptual CQA Plan was included as Section 6 of the SRAPI while the final design CQA Plan is included as Section 10 of the SRAPI. Geosyntec Consultants observed closure activities and provided necessary certifications.

2.2 Protection Layer

Protection of the infiltration layer was accomplished by the use of 24-inch earthen material. On the side slopes, the earthen material consisted of a 22-inch thick soil layer with 2-inch decorative rock layer. On the top decks, the earthen material consisted of 24-inches of soil. The source for erosion layer soils was native, non-impacted soil excavated from the base of the CAMU. The first 12-inches of the erosion layer consisted of screened, 1-inch minus soil while the second 10- to 12-inches consisted of 6-inch minus soil. The earthen material used for the erosion layer was free of debris, cobbles, rubbish, and roots.

The erosion layer was designed to be geotechnically stable to reduce failure, such as sloughing of the soils overlying the geomembrane/GCL composite infiltration layer (Section 2, Calculation Package I in the SRAPI). The materials were tested in accordance with the final CQA Plan to demonstrate they met the minimum strength requirements. Testing is documented in the CQA Reports prepared for each closure phase.

The surface of the CAMU erosion layer had a minimum slope of 2 percent to facilitate run-off while reducing erosion. The side slopes had a 3H:1V (Horizontal:Vertical) slope. The conceptual grading plan is shown on Figure J-9 in the SRAPI while the final grading plan is Attachment P-1.

The BMI Landfill grading mimicked the existing surface grading of the landfills. They were generally smoothed prior to cover system placement; however, minimum grades were not designed. The approximate grading for the BMI Landfills is shown in Attachment P-1. The as-built grading for the BMI Landfills is shown in their respective CQA Reports (SRAPI Sections 20 and 21).

2.3 Surface Water Drainage System

A surface water drainage system, designed by ATKINS (originally PBS&J), was constructed to convey runoff around and away from waste disposal areas. Surface water will be conveyed around the BRC CAMU to two retention basins located at the northeast and northwest corners of the site. The water is conveyed by concrete and rock-lined channels as well as pipes as shown in the final stormwater package (Attachment P-2). The channel and pipe locations correspond to the locations of the access roads for the BRC CAMU. Surface water from the top deck will be conveyed to the conveyance channels via two rip-rap lined channels in the northeast and northwest corners. Drainage channels are located along existing natural features to enhance surface runoff during high-precipitation events. Based on a 100-year storm event, the design will be sufficient to control erosion and maintain the stability of the slope (ATKINS, 2006).

2.4 Performance Evaluation of the Final Cover

The design of the final cover was evaluated using the Hydrologic Evaluation of Landfill Performance (HELP) model, which was developed by the U.S. Army Corps of Engineers for the USEPA and is widely used for evaluating the hydraulic performance of landfill cover systems (USEPA, 1993). The HELP model calculates daily, average, and worst-case estimates of water movement across, into, through, and out of landfills. The input parameters for the model include soil properties, precipitation and other climatological data, vegetation type, and landfill design information. Useful information

provided by the HELP model includes surface run-off, duration, and quantity of water storage within the erosion layer, and net infiltration through the cover system. The information is used for performance evaluation of the geocomposite and drainage pipe sizing, as described in Section 3.4 below.

Site-specific input parameters were used in the HELP model and are documented in Section 5, Calculation Package A in the SRAPI. The results indicated that the net infiltration through the cover system would be 0.000002 in/year.

3.0 SUMMARY OF COVER ANALYSIS

3.1 General

This section summarizes the results of design analyses that were performed for the final cover at the BRC CAMU Landfill site. The following calculations were performed and are located in the respective Calculation Package found in Section 5 unless otherwise noted of the SRAPI:

- Slope Stability Evaluation - Final Waste Slopes (Section 2, Calculation Package B);
- Comparison of Flow between a compacted clay liner (CCL) and geosynthetic clay liner (GCL) (Section 2, Calculation Package I);
- Drainage Geocomposite and Pipe Size Calculations (Calculation Package A);
- Veneer Stability Calculations (Calculation Package B);
- Cover Soil Sloughing Stability Calculations (Calculation Package C);
- Geotextile Filtration Calculations (Calculation Package D);
- Geotextile Puncture Protection Calculations (Calculation Package E);
- Pipe Strength Calculations (Calculation Package F); and
- Seismic Performance Evaluation (Calculation Package G).

The final cover system calculations are based on the conceptual design grading plans shown on Figure J-9 in Section 1 of the SRAPI. Changes to the final cover design resulting from Design Change Notifications (DCNs) were reevaluated with the calculation packages included with the DCNs. DCN packages were included with the final CQA Reports prepared for each closure phase (SRAPI Sections 17 through 21).

3.2 Slope Stability Evaluation - Final Waste Slopes

Geosyntec analyzed the stability of the final waste slopes for the BRC CAMU as discussed in Attachment J. The slope stability analysis is included in Section 2, Calculation Package B of the SRAPI.

3.3 Comparison of Flow between a CCL and GCL

Geosyntec demonstrated that the flow rate through the prescriptive composite liner system (i.e. - CCL) is greater than the flow rate through the alternative composite liner system (i.e. - GCL), as discussed in Attachment J. The comparison of flow between a CCL and GCL is presented in the SRAPI, Section 2, Calculation Package I.

3.4 Geocomposite and Pipe Size Calculations

A geocomposite will be placed above the geomembrane to collect and drain surface water that has infiltrated through the cover soil. Drainage pipes will be placed in the final cover to collect water from the geocomposite and drain the water to the perimeter surface water collection channels. Analyses were performed to model infiltration using U.S. Environmental Protection Agency's (USEPA) Hydrologic Evaluation of Landfill Performance (HELP) model.

The head on the cover liner was evaluated to be less than 12-in. at the top deck area, and negligible (i.e., less than 1/10-inch) on the side slopes. Furthermore, the calculations suggest that a 4-in diameter perforated corrugated polyethylene (CPE) pipe bedded in drainage aggregate will accommodate the maximum flow predicted by HELP model analyses. The 4-in. diameter perforated CPE pipe shall have a smooth interior wall to maximize pipe efficiency. Geocomposite and drainage pipe size calculations are presented in the SRAPI, Section 5, Calculation Package A.

3.5 Veneer Stability

The design criteria for the side slope liner system is to develop zero tension in the geosynthetics during installation of the final cover on the side slopes. Potential causes of tension in the liner system include construction equipment loading and overburden stresses (e.g., final cover materials). Based on the proposed grades and expected construction conditions, the calculations suggest that the side slope liner system will not be placed into tension provided a minimum interface friction angle of 20 degrees is maintained. Veneer stability calculations are presented in the SRAPI, Section 5, Calculation Package B.

3.6 Cover Liner Sloughing Stability

Based on the geocomposite and pipe size calculation results, no head buildup is expected above the side slope final cover system geosynthetic components. Calculations suggest that the minimum cover soil shear strength (interface with geocomposite or internal) of 27 degrees will meet the design factor of safety criteria of

1.5. the yield acceleration was found to be 0.15g (g = 32.2 ft/s^2). Cover liner sloughing calculations are presented in the SRAPI, Section 5, Calculation Package C.

3.7 Geotextile Filtration Requirements

A separation/filtration geotextile was used in the following applications: (i) a component of the geocomposite for the final cover system, and (ii) separation/filtration between the cover soil and drainage aggregate. The purpose of the separation/filtration geotextile is to limit migration of fine material from the cover soil into the geocomposite and drainage aggregate, thereby reducing the transmissivity and hydraulic conductivity of the respective materials. The calculations suggest that the separation/filtration geotextile have an apparent opening size (AOS) greater than sieve No. 70 (0.21 mm apparent opening size), a permittivity greater than 0.5 sec^{-1}, and sufficient mechanical strength properties. Geotextile separation/filtration calculations are presented in the SRAPI, Section 5, Calculation Package D.

3.8 Geotextile Puncture Protection

The geocomposite and geosynthetic clay liner (GCL) will protect the geomembrane from puncture by particles from the prepared subgrade and cover soil. The geotextile components of the drainage geocomposite will protect the geomembrane from puncture by oversized particles in the cover soil. The geotextile components of the GCL will protect the geomembrane from puncture by particles from the prepared subgrade. For the design loading condition, Geosyntec conservatively assumed an H-20 haul truck tire loading which exhibits a very high force related to hauling equipment. The analysis suggests that the following maximum particle sizes and geotextile mass per unit areas will be required:

Soil Component of Liner	Maximum Particle Size	Minimum Mass per Unit Area
Prepared Subgrade	1.5-in.	9 oz./yd^2 (GCL)
Cover Soil	1-in.	6 oz./yd^2 (single-sided geocomposite)

Table O-1, Geotextile Puncture Protection

Geotextile puncture protection calculations are presented in the SRAPI, Section 5, Calculation Package E.

3.9 Pipe Strength Calculations

Based on drainage pipe size analyses, a 4-in. diameter perforated CPE pipe will be used to collect and transport surface water that has infiltrated through the final

cover soil into the geocomposite on the top deck area of the landfill. Based on the calculations performed for the 4-in. diameter perforated CPE pipe, the pipe has adequate strength to withstand equipment (i.e., H-20 haul truck) and soil overburden loads. Pipe strength calculations are presented in the SRAPI, Section 5, Calculation Package F.

3.10 Seismic Performance Evaluation

3.10.1 General

Geosyntec performed an evaluation of the seismic performance of the BRC CAMU. The evaluation included a seismic hazard evaluation, site response analyses, development of site-specific deformation charts, and seismic deformation analyses for the final cover and base liner of the proposed BRC CAMU.

3.10.2 Seismic Hazard Evaluation

Geosyntec evaluated the seismic hazard at the site using the most recent United States Geological Survey (USGS) probabilistic seismic hazard maps (Frankel et al., 1996). For compliance with the State of Nevada regulations, Geosyntec considered motions with 2 percent probability of being exceeded in 50 years for use in design. The USGS data was used to establish the design free-field peak horizontal ground acceleration (PHGA) and set limits on the target acceleration response spectrum for design ground motions. The 2 percent probability of exceedence in 50 years USGS map values indicate that the free-field bedrock PHGA at the site equals 0.34 g from USGS. Based on the deaggregated hazard for Las Vegas, this PHGA was assigned a representative moment magnitude (M_w) of 6.5. The seismic hazard evaluation is presented in the SRAPI, Section 5, Calculation Package G.

3.10.3 Evaluation of Design Ground Motions

A suite of acceleration time histories considered representative of the 2 percent in 50 year ground motions evaluated in the seismic hazard analysis was selected for use in the seismic response analyses. Geosyntec selected a suite of three time histories that enveloped the target response spectrum using the following methodology: (i) screen the database of acceleration time histories on the basis of earthquake magnitude to select a reduced set of accelerograms; and (ii) plot the acceleration response spectra of the candidate accelerograms against the target acceleration response spectrum and select the representative accelerograms for use in design analyses. Using the above methodology, Geosyntec selected three candidate accelerograms to represent design ground motions at the BRC CAMU site: (i) the Parkfield earthquake, M_w 6.3, (ii) the Superstition Mountain earthquake, M_w 6.5, and (iii) the Big Bear Lake earthquake, M_w 6.7. Evaluation of the

design seismic ground motions are presented in the SRAPI, Section 5, Calculation Package G-1.

3.10.4 Site Response Analyses

One-dimensional site response analyses were performed for the BRC CAMU using the computer program SHAKE91 (Idriss et al., 1992). Analyses were performed for two conditions; (i) 30-ft of contaminated soil placed on the ground surface (i.e., the North Mesa), and (ii) 60-ft of contaminated soil placed 30-ft below grade (i.e., the South Mesa). Shear wave velocity and layer thickness data for the native soil was derived from spectral-analysis of surface waves (SASW) testing performed at the site by Dr. Barbara Luke at the University of Nevada at Las Vegas. Since the depth to bedrock is not known, the thickness to bedrock was varied to evaluate the effect of depth to bedrock on the results of the analysis. The calculated accelerations are all less than 0.50 g and generally decrease with increasing depth to bedrock. Site response analyses results are presented in the SRAPI, Section 5, Calculation Package G-2.

3.10.5 Site-Specific Seismic Deformation Charts

The site-specific deformation charts were developed using the computer program YSLIP_PM (Yan et al., 1996). YSLIP_PM is based upon the Newmark (Newmark, 1965) method for seismic deformation analysis. YSLIP_PM uses the yield acceleration of the slope (e.g., liner system or final cover system) and the output of the seismic site response analysis to compute seismic deformations. The results indicate that the largest seismic displacement response is calculated by applying the Parkfield earthquake record. The site-specific seismic deformation charts are presented in the SRAPI, Section 5, Calculation Package G-3.

3.10.6 Deformation Analyses

Geosyntec evaluated the expected seismically-induced permanent deformations at the BRC CAMU. The calculations suggest that the calculated seismically-induced permanent deformations are less than 3-in. for the final cover and less than 6-in. for the base liner. These deformations are less than current generally accepted limits for the final cover and for the base liner. Therefore, the seismic performance of the waste containment system proposed for the BRC CAMU is considered to meet current design standards. The site-specific seismic deformation calculations are presented in the SRAPI, Section 5, Calculation Package G-4.

4.0 COVER CONSTRUCTION REQUIREMENTS

4.1 General

This section describes the construction requirements for installation of the final cover system at the landfills. These construction requirements were necessary in order to ensure that the construction of the final cover system was consistent with the design performance goals and assumptions.

Initial conceptual Technical Specifications and a Construction Quality Assurance (CQA) plan were prepared for the construction of the final cover system that incorporates the construction requirements presented in this section. Geosyntec's proposed CQA Plan and Technical Specifications related to the final cover system are presented in the SRAPI, Section 6 and 7, respectively. The Final Technical Specifications and CQA Plan are provided in SRAPI Sections 9 and 10, respectively.

4.2 Slope Stability Evaluation

Final cover and interim waste soil slopes shall be constructed no steeper than a slope inclination of 3:1 (horizontal:vertical).

4.3 Geocomposite Requirements

A geocomposite will be used to collect infiltration of surface water through the cover soil. The geocomposite shall have the following properties:

- transmissivity no less than 5×10^{-4} m^2/sec under a confining pressure of 300 psf and a hydraulic gradient of 0.10.
- an 6 oz/yd^2 nonwoven geotextile bonded to each side of the geonet (i.e., double-sided); and
- the 6 oz/yd^2 nonwoven geotextile shall have sufficient permittivity and mechanical properties as summarized in Section 3.7.

4.4 Drainage Pipe Requirements

The drainage pipes used to collect water from the geocomposite shall be 4-in. diameter perforated CPE pipe with a smooth interior wall. The drainage pipes shall be backfilled with aggregate. The aggregate shall have a maximum particle size of 1-inch and a minimum hydraulic conductivity of 1×10^{-2} cm/sec.

4.5 Final Cover Soil

The cover soil shall be placed from the bottom-up, using equipment exerting a ground pressure between 4 and 10 psi. Cover soil was tested by ASTM D 4767 to identify the compaction effort and resulting compaction necessary to achieve a remolded angle of internal friction of 28 degrees. The compaction effort required to achieve compaction included the following:

- Compact the first 12-inch lift by 4 passes of a D-6 dozer;
- On 3H:1V slopes: compact the second 10-inch lift by 4 passes of a compactor with a weight exceeding 20,000 lb operating in vibratory mode going upslope and static mode while going down slope;
- On top deck: compact the second 10-inch lift by 2 passes of a compactor operating in vibratory ode in both directions; and
- Moisture condition both the first and second lift to within +/- 4% based on the 1-inch minus material modified proctor (ASTM D 1557).

These requirements are documents in the Final Technical Specifications (SRAPI, Section 9) and were observed by CQA personnel in accordance with the Final CQA Plan (SRAPI, Section 10). Surface water control and drainage was promoted.

4.6 Equipment Loadings

Equipment loads were limited to the following:

Maximum Allowable Ground Pressure (PSI)	Thickness of Soil Overlying the Geocomposite (ft)
<10	1.0
<20	>1.0 and <2.0
≥20	≥2.0

4.7 Geotextile Requirements

A double-sided geocomposite for drainage of the final cover liner system was installed. The geotextiles served a dual purpose - separation/filtration and cushion protection. The geotextile had the following properties:

Matrix	Nonwoven
Mass per Unit Area	6 oz/yd^2
Apparent Opening	≤ Sieve No. 70 (0.21mm)
Permittivity	≥ 0.5 sec-1

Grab Strength	≥ 130 lb
Puncture Strength	≥ 40 lb
Mullen Burst	≥ 210 psi
Trapezoidal Tear	≥ 40 lb
Ultraviolet strength retention	≥ 70%

The geocomposite installed is SKAPS 270-2-6.

4.8 Geosynthetic Clay Liner (GCL)

The GCL component of the final cover system has the following properties:

- Index flux not greater than 1 x 10^{-8} m^3/m^2-sec;
- Minimum interface/internal shear strength of 20 degrees;
- The GCL shall be dry during installation; and
- combined geotextile mass per unit area of 9 oz./yd^2.

The GCL installed is Cetco Bentomat DN.

4.9 Geomembrane Requirements

The geomembrane installed is Agru Microspike with a thickness of 60-mil.

4.10 Prepared Subgrade Requirements

The prepared subgrade consisted of interim cover and had a maximum designed exposed particle diameter less than 1.5-inch. Interim cover material consisted of 1-inch minus soil; therefore, the maximum exposure particle diameter was no greater than 1-inch.

4.11 Final Cover Surface Treatment

The final cover side slopes have a surface treatment to reduce surface erosion due to rainfall or wind forces. Two materials were used for erosion protection: ¾-inch Vista Gold rock and crushed site rock screened from cover materials. Vista Gold rock has a yellow appearance while the crushed site rock was gray in color. The top 12-inches of the drainage channels on the top deck consisted of Class II base compacted to 95% as determined by AASHTO T 180.

4.12 Stormwater Down-Drains

Stormwater falling on the final cover was conveyed via earthen channels to two down-drains, one in each the northeast and northwest corners of the CAMU. The

down-drains consisted of 12-inches of Class II base compacted to 90% over the cover geocomposite with 24-inches of D50=12-inches grouted riprap above the base.

4.13 Construction Quality Assurance

The Closure CQA Reports document that the Landfills were closed in accordance with these requirements and the requirements provided in the Technical Specifications (SRAPI, Section 9). Design Change Notifications (DCNs) changing the calculations, Technical Specifications, Drawings, and/or CQA Plan are included with the CQA Reports. The CQA Reports are located in the SRAPI as follows:

Phase	**CQA Report**	**Location in RAP**
Phase IIIA and a Portion of Phase II	CAMU Partial Final Closure Construction Quality Assurance Report, Phase IIIA & Portion of Phase II, April 2010	SRAPI Section 17
Phases I, II, IIIB, and IV	CAMU Partial Final Closure Construction Quality Assurance Report, Phases I, IIIB, IV, & Portions of Phases II & V, May 2010	SRAPI Section 18
Phase V	CAMU Final Closure Construction Quality Assurance Report, Phase V, April 2015	SRAPI Section 19
South BMI Landfill	South BMI Closure Construction Quality Assurance Report, June 2010	SRAPI Section 20
North BMI Landfill	North BMI Partial Final Closure Construction Quality Assurance Report, June 2010 Addendum to North BMI Partial Final Closure Construction Quality Assurance Report, April 2015	SCRAPI Section 21

5.0 CAMU POST-CLOSURE PLAN

This section of the permit application addresses post-closure activities for the Landfills, which commence after final closure is completed and extends for a period of 30 years therefrom. NDEP accepted the final Construction Quality Assurance Report for the CAMU on 1 July 2015, beginning the post-closure period. This Post-Closure Plan provides a description of procedures that will be used to maintain the integrity of the final cover systems.

5.1 Requirements After Closure

After closure of the BRC CAMU, a Restrictive Covenant on the landfill property deed, will be recorded in Clark County. The Covenant will in perpetuity notify any potential purchaser of the property that the land is used as a landfill and that its use is restricted to uses allowed under the terms and conditions of this Permit.

Permission may be requested in the future from the NDEP to remove the Covenant from the deed if all wastes are removed from the site. Any request would document that all wastes have been removed from the facility.

5.2 Program for Postclosure

Since closure of the Landfills, the program for post-closure is conducted as stipulated by the AOC3. This post-closure program monitors the integrity and effectiveness of the final cover, including making repairs to the cover as necessary to correct the effects of settlement, subsidence, erosion or other events.

Following completion of closure construction of the Landfills, certification in the form of the CQA Reports were submitted to the NDEP documenting closure. These were signed by an independent Nevada registered professional engineer and documented that the program was completed in accordance with the Construction Drawings, Technical Specifications, and CQA Plan (Attachments P-1 and P-2 and SRAPI Sections 9 and 10, respectively). The CQA Reports have been included as SRAPI Sections 17 through 21.

Post-closure use of the property will be managed to not disturb the integrity of the final cover, liner or other components of the BRC CAMU (e.g., surface water drainage network, infiltration monitoring system, etc.).

5.3 Land Use

The post-closure use of the BRC CAMU site is to install a solar field on top of the final cover, substantially covering the CAMU with the remainder maintained as open space containing a variety of native vegetation. Access to the site will continue to be restricted. Any solar field installed will be designed to be compatible with the design of the final cover. For additional discussion, please see Section 3.0 of the application. The final cover will not be compromised due to incompatible development. It is anticipated that this land use will be maintained beyond the 30-year required post-closure monitoring duration. However, no land use will be allowed that would compromise the integrity of the final cover system, the liner system, or other components of the containment or monitoring systems. The North and South BMI Landfills will remain as open space.

A Record of Survey which shall include a metes-and-bounds legal description of the closed BRC CAMU will be prepared and recorded with the clerk of Clark County. The recordation will include a notation that the property is a Corrective Action Management Unit and contains remediation waste.

5.4 Personnel

Post-closure care personnel will have received adequate training in their specific job duties. This includes applicable OSHA health-and-safety training as well as pertinent training in the Landfills' maintenance procedures. This staff will consist of a facility manager and various staff workers as needed. The name, address, and telephone number of the facility manager will be provided to the NDEP during the post-closure process.

Specific duties of these staff will include:

- Limiting access to the site and providing security;
- Performance of routine operations and maintenance activities;
- Responding to public or community inquiries;
- Ensuring regulatory compliance and maintaining appropriate documentation;
- Managing and coordinating post-closure monitoring (i.e., the leachate collection system); and
- Maintenance of the vegetative cover, if necessary.

5.5 Security

The perimeter fencing will remain around the Landfills. Security personnel will not be required 24-hrs because the waste will not be exposed nor will access by the

public or domestic livestock pose a health hazard. The perimeter fence will be maintained to deter trespassing. The periodic site inspection walks to assess the cover system will include an evaluation of the perimeter fence.

5.6 Operation and Maintenance

Routine maintenance will be required to maintain the effectiveness of the various Landfills' sub-systems. This will include periodic maintenance, and repairs of the final cover, the surface water drainage system, the leachate collection system, and the cover, as appropriate.

Routine operations and maintenance activities will include inspections of the Landfills. Particular attention will be given to any conditions that could compromise the integrity of the final cover or the associated surface water drainage system or the soil moisture monitoring system. Normal erosion processes are expected to result in the need to periodically replace some cover material and to fill depressions caused by settlement. Maintenance of the solar field to be installed on top of the final cover will be in accordance with the land lease between BRC and the third-party solar contractor, which will ensure proper protection of the cover.

5.7 Leachate Monitoring

Leachate volumes will be monitored in accordance with the Post-Closure Leachate Plan (Attachment Z-2) to keep leachate depths below 36-inches within the sumps (12-inches over the liner outside of the sumps). Leachate will be removed from the sumps and managed in accordance with the Post-Closure Leachate Plan (Attachment Z-2).

5.8 Post-Closure Inspections and Monitoring

Post-closure monitoring will be performed as outlined in Attachment N, Landfill (CAMU) Monitoring Plan. In summary, the final cover, leachate, settlement, and groundwater monitoring will be performed, as needed, for a period of 30 years after closure of the Landfills (Year 2045). Formal periodic inspections will be performed using site walks. These site walks will be performed within one week of significant precipitation events (e.g., greater than ¼ inch of rain during a 24-hour period) that could potentially impact either the surface water drainage system or the Landfills' cover. At a minimum, a site-wide inspection will be performed at least bi-annually. Inspection forms are included as Appendix A to Attachment N.

At least annually, an internal audit will be performed to verify that all activities at the site have been performed in accordance with the provisions of this Post-

Closure Plan. Inspection records will be kept and maintained in a log book in order to clearly document any changes in physical conditions. Copies of the inspection report will be provided to the NDEP annually. Post-closure inspections will occur for at least 30 years after the Landfills' closure.

5.9 Reports and Recordkeeping

The condition of the facility will be documented with field notes, maps, and photographs, as appropriate. Evidence of potential compromises in the cover will be recorded including eroded patches, extensive or significant animal burrows, subsidence, and cracks along the cover. Surface water drainage features will be inspected for the presence of debris, physical integrity, and evidence of conditions that exceeded design assumptions.

A copy of the plans for closure and post-closure will be maintained in the operating records of the site.

GENERAL NOTES

1. UNLESS OTHERWISE INDICATED ON THE DRAWINGS, THE TOPOGRAPHY, INCLUDING HORIZONTAL AND VERTICAL CONTROLS ARE FROM A SURVEY BY PENTACORE GEOGRAPHIC INFORMATION SYSTEMS, 6763 WEST CHARLESTON BLVD, LAS VEGAS, NEVADA, DATED SEP. 9, 1999.

   1.1. BASIS OF VERTICAL CONTROL:

   CITY OF HENDERSON BENCHMARK NO. 5 – BOLT AND WASHER IN THE TOP OF THE CURB ON THE EAST SIDE OF HIGHWAY 93, 100 FEET +/– NORTHWEST OF THE CENTERLINE OF KING STREET.

   NAVD 1988 DATUM ELEVATION = 519.021 METERS 1702.821 FEET

   1.2. BASIS OF HORIZONTAL CONTROL:

   THE BASIS OF BEARINGS FOR THIS PROJECT IS GRID NORTH AS DEFINED BY THE NEVADA COORDINATE SYSTEM OF 1983 (NCS83), EAST ZONE, (2701), DETERMINED BY GIS CONTROL POINTS, "851" , "884" AND "W51" AS SHOWN ON A RECORD OF SURVEY ON FILE IN THE CLARK COUNTY RECORDER'S OFFICE, IN FILE 88 OF SURVEYS, AT PAGE 53.

2. IN ACCORDANCE WITH SECTIONS 01050 AND 02200 OF THE TECHNICAL SPECIFICATIONS, CONTRACTOR SHALL PERFORM A BASELINE TOPOGRAPHICAL SURVEY PRIOR TO STARTING THE WORK.
3. A PRELIMINARY GEOTECHNICAL AND GEOLOGIC INVESTIGATION NO. 99-33437-01, DATED OCTOBER 22, 1999 PREPARED BY CONVERSE CONSULTANTS IS PART OF THE CONSTRUCTION DOCUMENTS.
4. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE FIELD INVESTIGATION OF THE EXISTING CONDITIONS AND FOR THE FIELD VERIFICATION OF EXISTING UNDERGROUND UTILITIES WITHIN THE PROPOSED WORK AREA. IF UNKNOWN UNDERGROUND UTILITIES ARE ENCOUNTERED DURING EXCAVATION, THE SUBCONTRACTOR SHALL IMMEDIATELY NOTIFY CONSTRUCTION MANAGER PRIOR TO CONTINUING THE WORK IN THE IMMEDIATE VICINITY.
5. THE CONTRACTOR SHALL PROTECT EXISTING UNDERGROUND AND ABOVEGROUND LINES AND ANY EXISTING IMPROVEMENTS AND EQUIPMENT WITHIN THE PROJECT LIMITS. ANY EXISTING CONSTRUCTION DAMAGED BY CONTRACTOR OPERATIONS SHALL BE REPAIRED OR REPLACED AT THE CONTRACTOR'S EXPENSE.
6. ALL UNDERGROUND UTILITIES SHALL BE PROPERLY PROTECTED DURING CONSTRUCTION FROM HEAVY EQUIPMENT BY THE USE OF SUITABLE TIMBER MAT OR STEEL MATTING.
7. DIMENSIONS, ELEVATIONS, AND LOCATION OF EXISTING UTILITIES ARE TO BE FIELD VERIFIED BY CONTRACTOR PRIOR TO START OF CONSTRUCTION.
8. STRAIGHT GRADE BETWEEN SPOT ELEVATIONS SHOWN UNLESS OTHERWISE INDICATED ON THE PLANS.
9. FINISHED SURFACES SHALL BE SLOPED UNIFORMLY FROM HIGH POINTS, RIDGE LINES, AND AROUND OBJECTS TO FLOW LINES AND AREA DRAINS UNLESS INDICATED OTHERWISE.
10. THE GEOTECHNICAL ENGINEER SHALL PROVIDE SUFFICIENT INSPECTIONS DURING THE EXCAVATION OF THE NATURAL GROUND AND THE PLACEMENT AND COMPACTION OF THE FILL TO BE SATISFIED THAT THE WORK IS BEING PERFORMED IN ACCORDANCE WITH THE PLANS AND SPECIFICATIONS.
11. EXCAVATION, EMBANKMENT, AND BACKFILL WORK AREAS SHALL BE CONTINUALLY AND EFFECTIVELY DRAINED. WATER SHALL NOT BE PERMITTED TO ACCUMULATE IN EXCAVATION OR FOUNDATION AREAS. THE SUBCONTRACTOR SHALL PROVIDE SUITABLE DIKES, DRAINS OR SHALL PROVIDE PUMPING EQUIPMENT AS REQUIRED TO DIVERT WATER FLOW AWAY FROM THE WORK AREAS. COLLECTED WATER SHALL BE USED AS DUST CONTROL ON WASTE OVER LINED AREAS OF THE CAMU.
12. SLOPES SHOWN ON GRADING PLANS ARE FOR INFORMATION ONLY. ACTUAL LINES SHALL BE VERIFIED BY FIELD MEASUREMENTS.
13. THE CONTRACTOR SHALL PERFORM GRADING OPERATIONS IN ACCORDANCE WITH EARTHWORK SPECIFICATION, SECTION 02200.
14. SUBCONTRACTOR SHALL COORDINATE WITH OTHER SUBCONTRACTORS IN THE WORK AREA. ANY DISPUTES BETWEEN SUBCONTRACTORS SHALL BE RESOLVED THROUGH THE CONSTRUCTION MANAGER.
15. THE SUBCONTRACTOR SHALL IMMEDIATELY NOTIFY CONSTRUCTION MANAGER FOR PROVISIONS OF THE APPROPRIATE MEANS OF DECOMMISSIONING UNDERGROUND UTILITIES ENCOUNTERED IN THE FIELD WITHIN HIS WORK PACKAGE LIMITS.
16. REFER TO "TECHNICAL DRAINAGE STUDY FOR EASTSIDE LANDFILL" DRAWINGS BY PBS&J, DATED AUGUST 2007, FOR CONSTRUCTION OF SURFACE WATER MANAGEMENT FEATURES. DURING CONSTRUCTION OF CAMU, ONLY EARTHWORK EXCAVATION OF BASINS AND CHANNELS, OUTLET STRUCTURES, PIPE AND MANHOLES ARE REQUIRED. DURING THE CAMU CONSTRUCTION AND WASTE PLACEMENT ACTIVITIES SUBSEQUENT TO COMPLETION OF THE FINAL COVER CONSTRUCTION, BASIN AND CHANNEL COMPLETION SHALL BE INSTALLED (RIPRAP, CONCRETE, GEOTEXTILE, ETC.).
17. REFER TO "IMPROVEMENT PLANS FOR EASTSIDE COMMON AREA REMEDIATION" DRAWINGS BY PBS&J, DATED AUGUST 2007, FOR CONSTRUCTION OF EASTSIDE WORK.
18. CONTRACTOR SHALL IMPLEMENT HEALTH AND SAFETY PROCEDURES FOR ALL PROJECT PERSONNEL IN ACCORDANCE WITH THE TECHNICAL SPECIFICATIONS AND STATE AND FEDERAL REGULATIONS.

NOTES:

1. FOR GENERAL NOTES, LEGEND AND ABBREVIATIONS, SEE DWG 2.
2. SEE "TECHNICAL DRAINAGE STUDY FOR EASTSIDE LANDFILL" DRAWINGS BY PBS&J, DATED OCTOBER 2006, FOR DETAILS ASSOCIATED WITH THE NORTHEAST DETENTION BASIN AND STORM DRAIN.
3. CONTRACTOR TO GRADE STORMWATER CONTROLS AS SHOWN ON THESE DRAWINGS DURING PHASE I PRIOR TO COMMENCEMENT OF CLEARING AND GRUBBING ON THE CAMU SITE. UPON COMPLETION OF FINAL COVER SYSTEM FOR CAMU, CONTRACTOR SHALL INSTALL FINAL STORMWATER CONTROLS IN ACCORDANCE WITH PBS&J PLANS TITLED "IMPROVEMENT PLANS FOR EAST SIDE LANDFILL," DATED AUGUST 2007.
4. INLET AND OUTLET STRUCTURES SHALL BE CONSTRUCTED DURING PHASE I PRIOR TO COMMENCEMENT OF CLEARING AND GRUBBING ON THE CAMU SITE. IN ACCORDANCE WITH PBS&J PLANS TITLED "IMPROVEMENT PLANS FOR EAST SIDE LANDFILL," DATED AUGUST 2007.

- APPROXIMATE LIMITS OF SLIT/WASTE TRENCH
- APPROXIMATE LIMITS OF SLIT/WASTE TRENCH EXCAVATION
- BS-11 BORING LOCATION AND NUMBER
- EXISTING POWER POLE (PROTECT IN PLACE)
- EXISTING MONITORING WELL (PROTECT IN PLACE)
- 3730 GRADING CONTROL POINT

NOTES:

1. FOR GENERAL NOTES, LEGEND AND ABBREVIATIONS, SEE DWG 2.
2. CONTRACTOR SHALL BACKFILL SLIT TRENCHES WITH SLIT TRENCH COVER SOIL THAT HAS BEEN SEGREGATED AND STOCKPILED ADJACENT TO SILT TRENCH EXCAVATION. ADDITIONAL BACKFILL NEEDED SHALL COME FROM THE PHASE IIIB, PHASE IV, AND PHASE V CELL EXCAVATION AS THE NEXT PRIORITY. IF ADDITIONAL SLIT TRENCH BACKFILL MATERIAL IS REQUIRED, MATERIAL SHALL BE OBTAINED FROM THE CLEAN SOIL STOCKPILE AREA.
3. CONTRACTOR SHALL BACKFILL WASTE TRENCH WITH WASTE TRENCH COVER SOIL AND CELL EXCAVATION SOIL FROM PHASE IIIB, IV, OR V TO FINAL GRADES IN AREAS WHERE THE WASTE TRENCH IS WITHIN THE CAMU FOOTPRINT AND TO WITHIN 1 FOOT OF THE FINAL GRADES IN AREAS WHERE THE WASTE TRENCH IS OUTSIDE OF THE CAMU FOOTPRINT AND WITHIN THE PROPERTY LINE. CONTRACTOR SHALL BACKFILL THE FINAL FOOT OF WASTE TRENCH IN AREAS WHERE THE WASTE TRENCH IS OUTSIDE THE CAMU FOOTPRINT AND WITHIN THE PROPERTY LINE WITH CLEAN ENGINEERED FILL. ANY WASTE TRENCH OUTSIDE OF THE PROPERTY LINE SHALL BE BACKFILLED WITH 100% CLEAN ENGINEERED FILL TO FINAL GRADES.

NOTES:

1. FOR GENERAL NOTES, LEGEND AND ABBREVIATIONS, SEE DWG 2.
2. WOVEN GEOTEXTILE SHALL BE INSTALLED ON SIDE SLOPES ABOVE FIRST LIFT OF OPERATIONS LAYER AS SHOWN ON DETAIL 9. PRIOR TO PLACEMENT OF SUBSEQUENT LIFTS OF OPERATIONS LAYER ON SIDE SLOPES WASTE MATERIAL SHALL BE PLACED AGAINST PREVIOUS LIFT OF OPERATIONS LAYER AND WOVEN GEOTEXTILE SHALL BE CUT SUCH THAT THE BOTTOM 6" WILL BE COVERED WITH THE NEXT LIFT OF OPERATIONS LAYER. AT NO TIME SHALL THE GEOCOMPOSITE BE EXPOSED TO SUN LIGHT (AFTER WOVEN GEOTEXTILE IS CUT, BEFORE OPERATIONS LAYER MATERIAL PLACED) FOR MORE THAN TWO DAYS. CONTRACTOR SHALL REPAIR ANY CUTS OR DAMAGE TO UNDERLYING GEOSYNTHETIC MATERIALS.
3. SHOTCRETE SHALL BE INSTALLED WITH A TROWELED FINISH. ENGINEERED FILL SHALL BE COMPACTED IN ACCORDANCE WITH THE TECHNICAL SPECIFICATIONS.
4. DETAILS ARE SHOWN TO SCALE INDICATED EXCEPT FOR THE GEOSYNTHETICS, WHICH ARE SHOWN AT AN EXAGGERATED SCALE FOR CLARITY.
5. CUT WOVEN GEOTEXTILE, GEOCOMPOSITE, AND GEOMEMBRANE AT TOP EDGE OF TEMPORARY ANCHOR TRENCH. OVERLAP GCL 12 INCHES AND SEAM GEOMEMBRANE, GEOCOMPOSITE, AND WOVEN GEOTEXTILE IN ACCORDANCE WITH THE TECHNICAL SPECIFICATIONS. TEMPORARY ANCHOR TRENCH TO REMAIN IN PLACE.
6. WRAP VISQUEEN AROUND EDGE OF GEOSYNTHETICS TO PREVENT WATER, SOIL, OR OTHER DAMAGE OF THE EXPOSED EDGE OF LINER SYSTEM COMPONENTS. WHEN MAKING TIE-IN, CUT AND REMOVE TOP PORTION OF VISQUEEN.

AT NO TIME SHALL THE GEOCOMPOSITE BE EXPOSED TO SUN LIGHT (AFTER WOVEN GEOTEXTILE IS CUT, BEFORE OPERATIONS LAYER MATERIAL PLACED) FOR MORE THAN TWO DAYS. CONTRACTOR SHALL REPAIR ANY CUTS OR DAMAGE TO UNDERLYING GEOSYNTHETIC MATERIALS.
3. DETAILS ARE SHOWN TO SCALE INDICATED EXCEPT FOR THE GEOSYNTHETICS, WHICH ARE SHOWN AT AN EXAGGERATED SCALE FOR CLARITY.
4. PIPE BOOT SHALL INCLUDE ¼" CLOSED CELL NEOPRENE BETWEEN THE PIPE AND GEOMEMBRANE, ⅜" STAINLESS STEEL T-BOLT CLAMP, AND SILICONE SEALANT ALONG GEOMEMBRANE EDGE OF BOOT.
5. GEOMEMBRANE AND GCL COMPONENTS OF VADOSE ZONE SUMP MONITORING LINER SYSTEM SHALL EXTEND 1 FT PAST THE HINGE POINT, WHILE GEOCOMPOSITE SHALL TERMINATE AT THE HINGE POINT.
6. PIPE PERFORATIONS > 1/4" AND < 3/4" SHALL BE WRAPPED IN 6 oz/yd² FILTRATION GEOTEXTILE. PIPE PERFORATIONS SHALL NOT EXCEED 3/4".
7. BENTONITE PLUG SHALL CONSIST OF GRANULAR BENTONITE AND SHALL COMPLETELY SURROUND THE 12" HDPE SIDE SLOPE PIPE BETWEEN VADOSE ZONE GEOMEMBRANE AND OVERLYING LINER SYSTEM GCL.

NOTES:

1. FOR GENERAL NOTES, LEGEND AND ABBREVIATIONS, SEE DWG 2.
2. FINAL COVER SURFACE REPRESENTS THE COVER SURFACE AFTER APPROXIMATELY 3.0 MILLION CUBIC YARDS OF WASTE HAVE BEEN PLACED IN THE CAMU. THE EXACT VOLUME OF WASTE PLACED IN THE CAMU AND COVER CONFIGURATION WILL NOT BE DETERMINED UNTIL THE ENTIRE PROJECT WASTE HAS BEEN REMEDIATED AND FINAL WASTE VOLUME IS DETERMINED. FOR BIDDING PURPOSES, REFER TO QUANTITIES SPECIFIED ON THE BID SCHEDULE.

CLARK COUNTY TRAFFIC NOTES

1. ALL PERMANENT TRAFFIC CONTROL DEVICES CALLED FOR HEREIN SHALL BE IN PLACE AND IN FINAL POSITION PRIOR TO ALLOWING ANY PUBLIC TRAFFIC ONTO THE PORTIONS OF THE ROAD(S) BEING IMPROVED HEREUNDER, REGARDLESS OF THE STATUS OF COMPLETION OF PAVING OR OTHER OFF-SITE IMPROVEMENTS CALLED FOR BY THESE PLANS.
2. BEFORE ANY WORK IS STARTED IN THE RIGHT-OF-WAY, THE CONTRACTOR SHALL INSTALL ALL ADVANCE WARNING SIGNS FOR THE CONSTRUCTION ZONE. THE CONTRACTOR SHALL INSTALL TEMPORARY GROUND-MOUNTED STOP SIGNS AT ALL NEW STREET ENCROACHMENTS INTO EXISTING COUNTY STREETS IMMEDIATELY AFTER FIRST GRADING WORK IS ACCOMPLISHED, AND SHALL MAINTAIN SAID SIGNS UNTIL PERMANENT SIGNS ARE INSTALLED.
3. ALL CONSTRUCTION SIGNING, BARRICADING AND PAVEMENT MARKINGS SHALL CONFORM TO THE NEVADA WORK ZONE TRAFFIC CONTROL HANDBOOK – 1986 AND TO THE MANUAL ON UNIFORM TRAFFIC CONTROL DEVICES, CURRENT EDITION.
4. IF THE IMPROVEMENTS NECESSITATE THE OBLITERATION, TEMPORARY OBSTRUCTION, TEMPORARY REMOVAL OR RELOCATION OF ANY EXISTING TRAFFIC PAVEMENT MARKING, SUCH PAVEMENT MARKING SHALL BE RESTORED OR REPLACED WITH LIKE MATERIALS TO THE SATISFACTION OF THE COUNTY TRAFFIC MANAGER.
5. THE DEVELOPER SHALL BE RESPONSIBLE TO PROVIDE AND INSTALL ALL PERMANENT SIGNS SHOWN ON THE PLANS. STREET NAME SIGNS SHALL CONFORM IN THEIR ENTIRETY TO CLARK COUNTY AREA STANDARDS. ALL OTHER SIGNS SHALL BE STANDARD SIZE UNLESS OTHERWISE SPECIFIED ON THE PLANS. ALL SIGN POSTS SHALL BE INSTALLED IN ACCORDANCE WITH CLARK COUNTY AREA STANDARDS. ALL SIGNS SHALL USE TYPE III SHEETING.
6. IF A PROPOSED STREETLIGHT STANDARD IS FIELD LOCATED TO WITHIN FIVE (5) FEET OF ANY SIGN SHOWN HEREON TO BE MOUNTED ON A SIGN POST, THEN CHANGE SIGN MOUNTING TO ONE ON THE STREETLIGHT STANDARD.
7. PRIOR TO CONSTRUCTION, THE STREET SIGN CONTRACTOR SHALL OBTAIN STREET NAMES AND BLOCK NUMBERING FROM THE CURRENT PLANNING DIVISION OF THE DEPARTMENT OF COMPREHENSIVE PLANNING.
8. ALL TRAFFIC SIGNAL POLE ASSEMBLIES, STEEL PEDESTALS FOR CABINETS, AND STREETLIGHT POLES SHALL BE GALVANIZED PER ASTM A-123.
9. ALL STREET LIGHTING INSTALLATIONS EXCEPT AS NOTED ON THE STREET LIGHTING PLANS SHALL CONFORM TO THE UNIFORM STANDARD DRAWINGS AND THE UNIFORM STANDARD SPECIFICATIONS FOR PUBLIC WORKS CONSTRUCTION, OFF-SITE IMPROVEMENTS, CLARK COUNTY AREA, NEVADA, LATEST EDITION OF EACH.
10. THE FOLLOWING CLARK COUNTY UNDERGROUND FACILITIES MAY BE LOCATED IN THIS PROJECT AREA: STREET LIGHTING, TRAFFIC SIGNALS AND FREEWAY AND ARTERIAL SYSTEM OF TRANSPORTATION (F.A.S.T.) INTERCONNECT CABLE. YOU MUST CONTACT CLARK COUNTY TRAFFIC MANAGEMENT DIVISION, OPERATIONS UNIT AT 455-7511 FOR LOCATIONS AT LEAST 48 HOURS PRIOR TO WORKING IN THE AREA. CLARK COUNTY IS NOT A MEMBER OF CALL BEFORE YOU DIG (UNDERGROUND SERVICE ALERT), AND A CALL TO THAT ORGANIZATION DOES NOT RELIEVE CONTRACTOR OF LIABILITY FOR CLARK COUNTY FACILITIES.
11. F.A.S.T. INTERCONNECT CABLE POLICY IS IN EFFECT. INTERCONNECT CABLE MUST BE MAINTAINED AT ALL TIMES. DEVELOPER/CONTRACTOR SHALL PROVIDE TEMPORARY OVERHEAD INTERCONNECT CABLE, WHILE PERMANENT CABLE IS BEING RELOCATED. TEMPORARY AERIAL INSTALLATION MUST BE ACCEPTABLE TO THE COUNTY TRAFFIC MANAGER AND TO F.A.S.T. ANY DAMAGE TO THIS CABLE IS DEEMED AN EMERGENCY BY F.A.S.T, CITY OF LAS VEGAS, CLARK COUNTY AND NDOT AND MUST BE REPAIRED IMMEDIATELY TO F.A.S.T. ACCEPTANCE. $2,500 PER DAY DAMAGES MAY BE ASSESSED AFTER 24 HOURS HAS ELAPSED FROM TIME OF BREAK OR DAMAGE.
12. ALL NEW OR REPLACEMENT TRAFFIC SIGNAL LOOPS SHALL BE INSTALLED USING CABLE-IN-DUCT WIRING, SHALL HAVE INDEPENDENT LEAD-IN WIRES FOR EACH LOOP FROM THE CONTROLLER TO THE PULL-BOX, AND EACH LEAD-IN SHALL BE INDIVIDUALLY TAGGED.
13. TRAFFIC SIGNAL PEDESTRIAN HEADS SHALL BE THE LED TYPE.
14. ELECTRICAL POWER SERVICE POINT LOCATION(S) FOR STREET LIGHTING AND TRAFFIC SIGNALS MUST BE INDICATED ON THE PLANS. IF CONNECTING TO AN EXISTING CIRCUIT, INDICATE LOCATION OF EXISTING SERVICE POINT FOR EACH CIRCUIT.
15. WHEN STREET LIGHTS ARE TO BE CONNECTED TO AN EXISTING CIRCUIT, THE ELECTRICAL ENGINEER MUST CERTIFY THAT THE EXISTING CIRCUIT IS CAPABLE OF HANDLING THE ADDITIONAL CIRCUIT LOAD.
16. CLARK COUNTY RESERVES THE RIGHT TO REJECT STREETLIGHT AND TRAFFIC SIGNAL POLES AND ASSEMBLIES WHICH HAVE A "STRIPED" APPEARANCE.
17. PRIOR TO BEGINNING OF CONSTRUCTION, MODIFICATION, OR RELOCATION OF ANY TRAFFIC SIGNAL SYSTEM, WRITTEN NOTICE SHALL BE SUBMITTED TO THE CLARK COUNTY TRAFFIC MANAGEMENT DIVISION OF THE DATE THAT WORK WILL BEGIN.
18. THREE (3) NORMAL WORKING DAYS PRIOR TO TURN-ON OR COMPLETION OF MODIFICATIONS TO A TRAFFIC SIGNAL SYSTEM, WRITTEN NOTICE SHALL BE SUBMITTED TO THE CLARK COUNTY TRAFFIC MANAGEMENT DIVISION THAT WORK IS BEING COMPLETED AND THE PROPOSED DATE OF COMPLETION.

CLARK COUNTY FIRE DEPARTMENT NOTES

1. ALL WORK SHALL BE DONE IN STRICT ACCORDANCE WITH THE 1997 EDITION OF THE UNIFORM FIRE CODE, AND THE 1995 EDITION OF NATIONAL FIRE PROTECTION ASSOCIATION PAMPHLET #24.
2. ON ANY BUILDING CONSTRUCTION , ACCESSIBLE FIRE HYDRANTS SHALL BE INSTALLED BEFORE COMBUSTIBLE MATERIALS ARE DELIVERED TO THE SITE AND CONSTRUCTION COMMENCES. SAID FIRE HYDRANTS SHALL BE IN GOOD WORKING ORDER WITH THE REQUIRED WATER SUPPLY.
3. IF, DURING CONSTRUCTION, IT BECOMES NECESSARY TO CLOSE ANY CONTROL VALVE OR PLACE A HYDRANT OUT OF SERVICE, THE CLARK COUNTY FIRE DEPARTMENT MUST BE CONTACTED.
4. PAINTING OF CURBS AND/OR STRIPING OF ASPHALT AREAS AND PROTECTION OF HYDRANTS FROM PHYSICAL INJURY PER FIRE HYDRANT INSTALLATION SPECIFICATIONS OF THE FIRE PREVENTION BUREAU.
5. NO FIRE HYDRANT SHALL BE LOCATED WITHIN 25 FEET OF ANY STRUCTURE, OR WITHIN 5 FEET OF ANY DRIVEWAY, POWER POLE, LIGHT STANDARD, OR ANY OTHER OBSTRUCTION. FOR WALL, FENCE, AND PLANTER LOCATIONS, A PERIMETER AROUND THE HYDRANT MEASURING A MINIMUM OF 3 FEET FROM ITS EXTERIOR SHALL BE MAINTAINED CLEAR OF ALL OBSTRUCTIONS AT ALL TIMES.
6. AT ALL TIMES DURING CONSTRUCTION, SUITABLE EMERGENCY VEHICLE ACCESS ROADS MUST BE MAINTAINED. ROADWAYS MUST BE SMOOTH, COMPACTED, AND CAPABLE OF SUPPORTING THE IMPOSED LOADS OF ALL EMERGENCY VEHICLES.
7. PRIOR TO ACCEPTANCE OF ANY PRIVATE FIRE SERVICE MAIN, A SATISFACTORY HYDROSTATIC TEST WITH PIPING JOINTS UNCOVERED MUST BE CONDUCTED. APPROVED PLANS AND A CONTRACTOR'S MATERIALS AND TEST CERTIFICATE MUST BE PROVIDED AT THE TIME OF THE INSPECTION.
8. BLUE REFLECTIVE MARKERS MUST BE INSTALLED BEFORE FINAL HYDRANT ACCEPTANCE CAN BE ATTAINED. [97 UFC Sec. 901.4.3].

GENERAL NOTES

1. ALL CONSTRUCTION AND MATERIALS SHALL BE IN ACCORDANCE WITH THE "UNIFORM STANDARD SPECIFICATIONS AND STANDARD DRAWINGS CLARK COUNTY AREA NEVADA AND "CLARK COUNTY SUPPLEMENT TO UNIFORM STANDARD DRAWINGS AND SPECIFICATIONS", LATEST REVISION; ANY OTHER APPLICABLE APPROVED STANDARDS ISSUED BY THE CONTROLLING AGENCY, THE UNIFORM BUILDING CODE, AND ALL APPLICABLE CODES AND ORDINANCES.

   "TECHNICAL SPECIFICATIONS FOR THE CONSTRUCTION OF CORRECTIVE ACTION MANAGEMENT UNIT" SHALL GOVERN IN CASES WHERE SPECIFICATIONS CONFLICT.
2. THE CONTRACTOR SHALL NOTIFY ALL UTILITY COMPANIES AT LEAST 48 HOURS PRIOR TO COMMENCING CONSTRUCTION.
3. LOCATION OF UNDERGROUND UTILITIES SHOWN ON THE DRAWING WERE OBTAINED BY A SEARCH OF AVAILABLE RECORDS. NEITHER THE OWNER NOR THE ENGINEER ASSUME ANY RESPONSIBILITY FOR UTILITIES OR STRUCTURES NOT SHOWN OR NOT IN THE LOCATION SHOWN ON THE DRAWINGS.
4. THE CONTRACTOR SHALL TAKE ALL PRECAUTIONARY MEASURES NECESSARY TO PROTECT EXISTING IMPROVEMENTS, WHICH ARE TO REMAIN IN PLACE. SHOULD ANY DAMAGE OCCUR, THE CONTRACTOR SHALL BE LIABLE AND SHALL PROVIDE REPAIR AT HIS/HER EXPENSE, AND TO THE APPROVAL OF THE ENGINEER AND THE APPROVAL OF THE DAMAGED PARTY
5. CUT SHEETS MUST BE SUBMITTED TO THE AGENCY BEFORE CONSTRUCTION WILL BE PERMITTED TO START.
6. PROPER SIGNS, BARRIERS, BARRICADES AND LIGHTS SHALL BE PLACED AND MAINTAINED IN ACCORDANCE WITH THE LATEST "MANUAL OF UNIFORM TRAFFIC CONTROL DEVICES FOR STREETS AND HIGHWAYS". TRAFFIC, SCHOOL, OR STREET SIGNS OF ANY KIND ARE NOT TO BE MOVED FOR ANY REASON WITHOUT FIRST COORDINATING WITH THE DEPARTMENT OF DEVELOPMENT SERVICES, CIVIL ENGINEERING DIVISION INSPECTOR @ 455-4610.
7. THIS PLAN DOES NOT AUTHORIZE THE CLOSURE OF ANY ROAD OR STREET.
8. NO OPEN TRENCH SHALL BE ALLOWED ACROSS ANY STREET OR WITHIN TEN (10') FEET OF ANY TRAVEL-WAY, EXCEPT WHEN WORK IS IN ACTUAL PROGRESS. AREAS COVERED BY ACCEPTABLE STEEL PLATE ARE NOT TO BE CONSTRUED AS A TRENCH. NO OPEN TRENCH IS PERMITTED IN EXCESS OF 500 FEET OR LENGTH NECESSARY TO ACCOMMODATE PIPE INSTALLATION IN A SINGLE DAY, WHICH EVER IS GREATER. ALL TRENCH CROSSINGS AND BACKFILL SHALL MEET THE STANDARD SPECIFICATION UNLESS OTHERWISE STATED.
9. A TEMPORARY PATCH IS TO BE IN PLACE AT THE END OF EACH WORK DAY WHERE THE BACKFILL IN THE TRENCH HAS BEEN COMPLETED AND PRIOR TO OPENING THE WORK AREA BACK OF TRAFFIC AND IS TO BE MAINTAINED BY THE PERMITEE. A PERMANENT PATCH IS TO BE IN PLACE WITHIN THIRTY (30) DAYS AFTER THE INSTALLATION OF THE TEMPORARY PATCH.
10. COMPACTION TESTS ARE REQUIRED.

PLAN

GENERAL NOTES:

1. CONCRETE SHALL BE CLASS AA.
2. REINFORCING STEEL SHALL BE DEFORMED BARS WITH MAXIMUM SPACING OF 18" SET 2 1/2" CLEAR OF SURFACE OF CONCRETE EXCEPT AS NOTED. BAR ENDS SHALL BE KEPT 1 1/2" CLEAR OF SURFACE OF CONCRETE. REINFORCING BARS MAY BE CUT AND BENT IN FIELD.
3. FOOTINGS SHOWN ARE OF MINIMUM DEPTH AND SHALL BE EXTENDED IF SOIL IS UNSUITABLE OR LIABLE TO SCOUR.
4. CULVERT PIPES TO BE SET ON A SKEW SHALL BE MITERED WHEN HEADWALLS ARE CONSTRUCTED. WHEN HEADWALLS ARE NOT CONSTRUCTED THE PIPES SHALL NOT BE MITERED EXCEPT IN OVERFLOW SECTION.
5. FOR ESTIMATING HEADWALL QUANTITIES ON SKEWED CULVERTS:
   0° to 10° USE QUANTITIES FOR 0° SKEW.
   11° to 25° USE QUANTITIES FOR 15° SKEW.
   26° to 40° USE QUANTITIES FOR 30° SKEW.
   41° to 55° USE QUANTITIES FOR 45° SKEW.
   OVER 55° CALCULATE QUANTITIES REQUIRED.
   CULVERTS SHOULD BE INSTALLED ON 5° INCREMENTS WHERE IT IS FEASIBLE.
6. DIMENSIONS X, Y, L, AND h TO REMAIN CONSTANT REGARDLESS OF MINOR VARIATIONS IN WALL THICKNESS DUE TO CLASS OF PIPE USED.

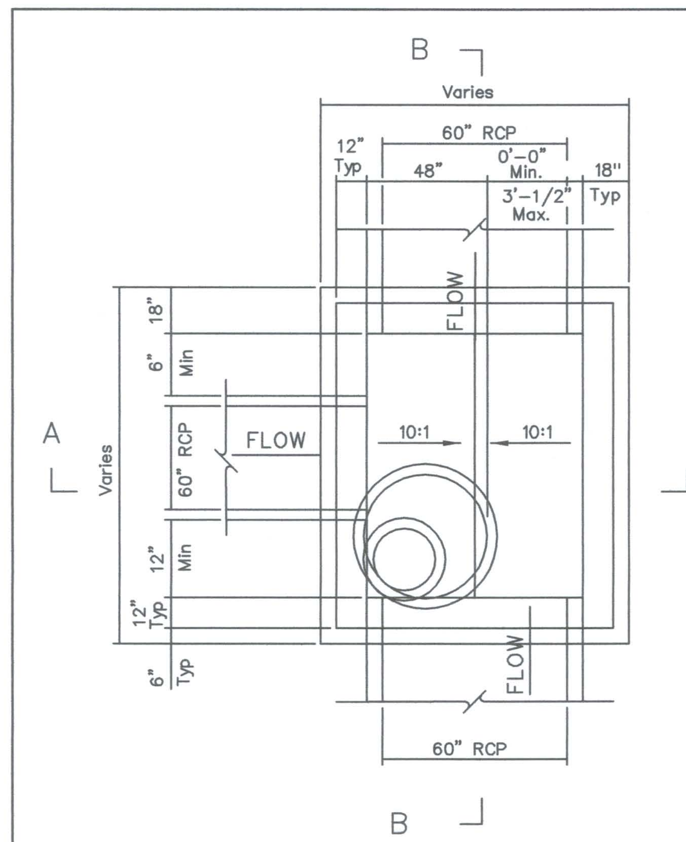
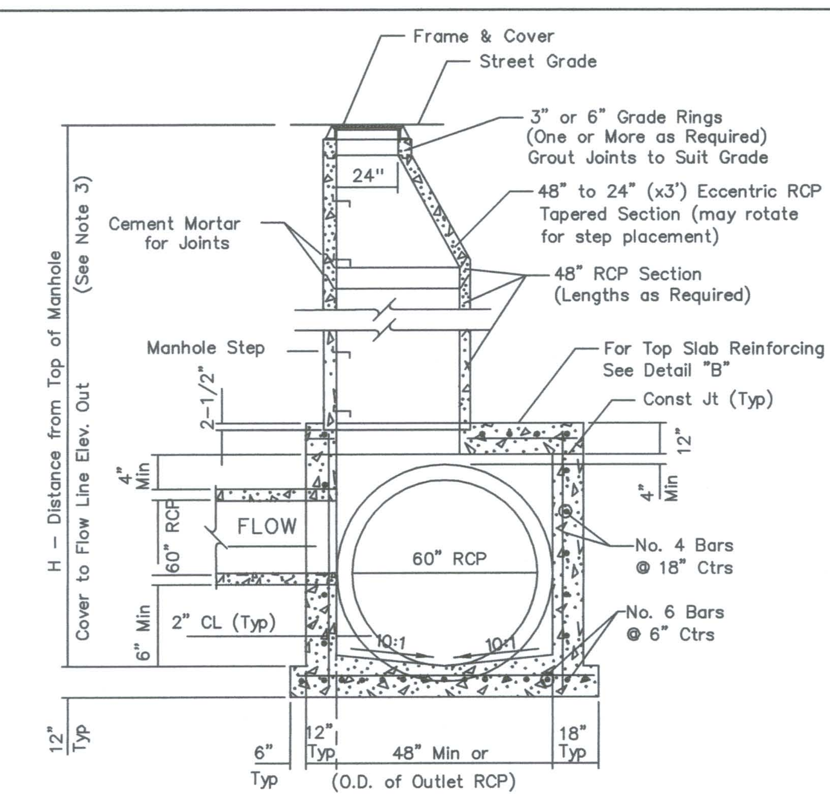
CHIEF HYDRAULICS ENGINEER	ADOPTED 8/69 REVISION 12/94



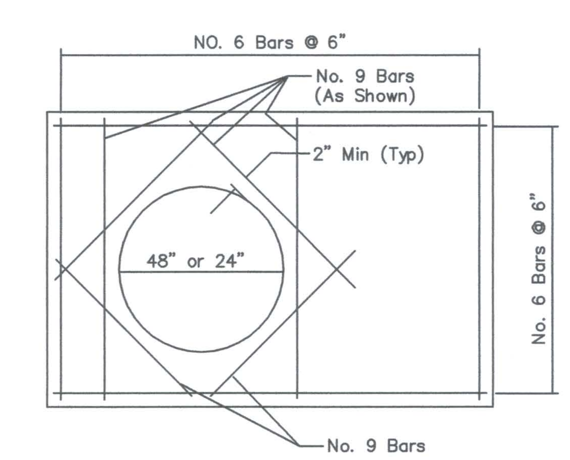
PLAN



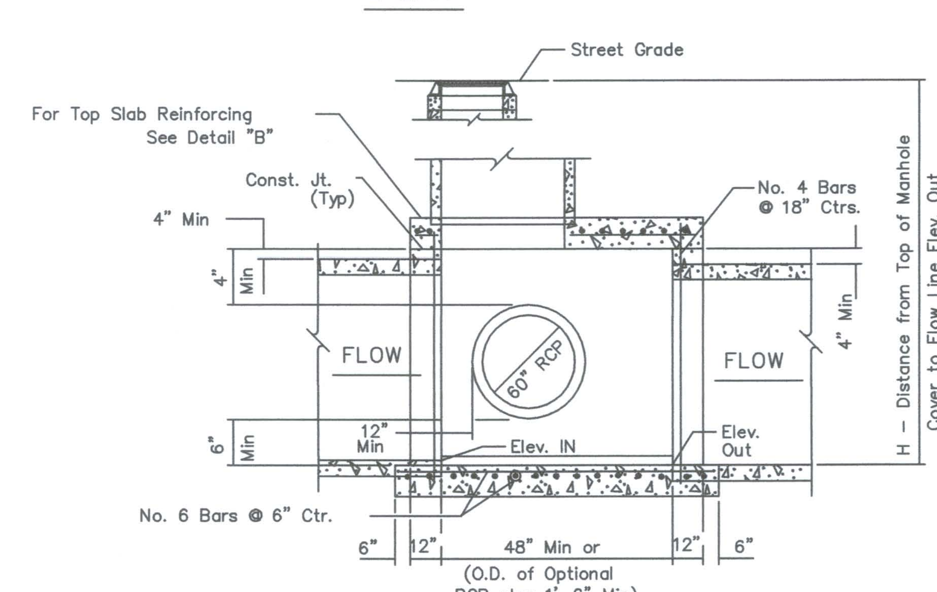
SECTION A-A
(For Variable Height Situations)

GENERAL NOTES:

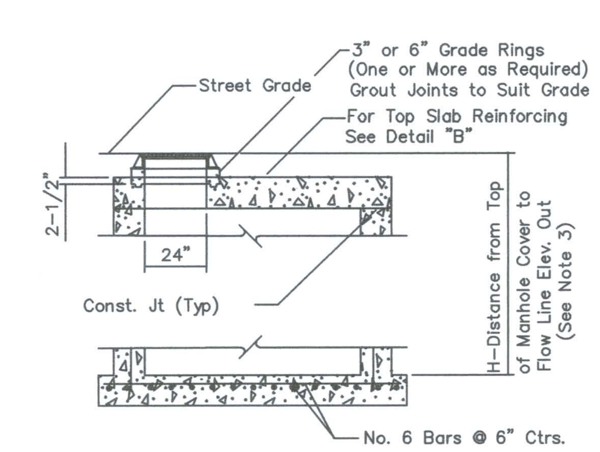
1. ALL CONCRETE SHALL BE CLASS AA.
2. MANHOLES WITH MORE THAN ONE PIPE: THE INFLOW PIPE INVERT ELEVATIONS SHALL BE GREATER THAN OR EQUAL TO 0.1' ABOVE THE OUTFLOW PIPE INVERT ELEVATION.
3. FOR VALUES OF "H", SEE PLANS. "H" IS THE DIFFERENCE IN ELEVATION BETWEEN THE OUTFLOW PIPE INVERT ELEVATION AND THE TOP OF MANHOLE ELEVATION AT STREET GRADE.
4. PRECAST CONCRETE PIPE SECTIONS, TAPERED SECTIONS, LIDS, GRADE RINGS, AND STEPS SHALL CONFORM TO AASHTO M 199 (ASTM C-478).
5. MANHOLE COVER SHALL BEAR ENTITY IDENTIFICATION AND SYSTEM FUNCTION (IF APPLICABLE).
6. SHAPE FLOWLINE IN MANHOLE TO OUTLET PIPE, AND PROVIDE A 10:1 MINIMUM SLOPE FROM ALL DIRECTIONS TOWARD FLOW LINE.



DETAIL "B"
(TOP SLAB REINFORCING)



SECTION B-B



SECTION A-A
(For Minimum Height Situation)
Note: Hydraulic Engineer Will Look at Other Options for Extreme Minimum Cover Situations.

KEY NOTES

1. INSTALL 60" CL III RCP SD PER CCAUSD DWG No. 502 AND CCAUSS 206, 207, 208, 601, 603, 708
2. INSTALL 42" CL III RCP SD PER CCAUSD DWG No. 502 AND CCAUSS 206, 207, 208, 601, 603, 708
3. INSTALL 42" EQUIVALENT CL III RCP ELLIPTICAL SD PER CCAUSD DWG No. 502 AND CCAUSS 206, 207, 208, 601, 603, 708
4. NOT USED
5. INSTALL TYPE III MANHOLE PER CCAUSD DWG No. 406 AND CCAUSS 609 (1)
6. INSTALL 42" HEADWALL PER NDOT STD R-2.5.2 AND CCAUSS 502, 505, 713 SEE DETAIL SHEET D2
7. INSTALL 60" HEADWALL PER NDOT STD R-2.5.2 AND CCAUSS 502, 505, 713 SEE DETAIL SHEET D2
8. INSTALL CHANNEL AND ACCESS RD. PER DETAIL "A" SHEET D1
9. INSTALL 24" THICK D_{50}=12" RIPRAP OVER 6" TYPE II BEDDING PER CCAUSS 302, 610, 704.03.04
10. INSTALL EMBANKMENT CHANNEL PER DETAIL "B" SHEET D1
11. INSTALL TRASH RACK PER DETAIL "D" SHEET D1
12. REMOVE EXISTING CAP AND EXTEND 60" RCP
13. INSTALL 60" PLUG FOR RCP
14. INSTALL EQUALIZER BASIN OVERFLOW PER DETAIL "C" SHEET D1
15. INSTALL 12" THICK BY 10' WIDE TYPE II GRAVEL ACCESS DRIVE PER CCAUSS 704.03.04, 302
16. INSTALL 24" THICK D_{50}=12" GROUTED RIPRAP OVER 6" TYPE II BEDDING PER CCAUSS 302, 610, 704.03.04
17. INSTALL 6" CONCRETE OVER 6" TYPE II AGG. BASE PER CCAUSS 302, 409, 501, 611, 701, 702, 706
18. INSTALL 42" EQUIVALENT RCP ELLIPTICAL HEADWALL PER NDOT STD R-2.7.1 SEE DETAIL SHEET D2

NOTES

1. ALL TYPE II AGGREGATE TO CONFORM TO CCAUSS 704.03.04.
2. ALL CONCRETE SHALL BE CLASS AA PER CCAUSS #501.

Closure and Post-Closure Cost Estimates

Basic Remediation Company (BRC)

Corrective Action Management Unit (CAMU)

Henderson, Nevada

Table of Contents

1.0 Introduction Q-1
2.0 Closure costs Q-1
3.0 Post-Closure Costs Q-1

List of Tables

Table Q-1 Closure Cost Estimate

Table Q-2 Post-Closure Cost Estimate

1.0 INTRODUCTION

The actual cost to close and projected cost to provide post-closure care is provided in this Attachment. The closure costs presented herein are the actual costs to close the Landfills (BRC CAMU, South BMI, and North BMI Landfills) (Table Q-1). The post-closure cost estimates summarized herein are for budgeting and planning purposes only (Table Q-2).

The post-closure cost estimate is based on the RS Means Heavy Construction Cost Data for 2015 and professional judgment and experience. The cost is then adjusted for indexes such as city costs and consulting costs. The cost estimates are based on the costs to the owner or operator for hiring a third party to close the facility.

2.0 CLOSURE COSTS

The closure costs included liner, drainage, and soil materials as well as ENTACT's overhead costs. The breakdown is provided in Table Q-1. The total cost of CAMU closure was $8,408,000.

3.0 POST-CLOSURE COSTS

The post-closure cost estimate is based on the 30-year cost of annual inspection, monitoring, and maintenance at the BRC CAMU. Inspections, monitoring, and maintenance activities are covered in detail in Attachment O, Closure and Post-Closure Plan. The components of post-closure cost estimate are broken down in Table Q-2. The original Net Present Value (NPV) of the 30-year total cost of post-closure developed in 2006 was $1,990,000, which is based on a 4% discount rate. The 2020 post-closure costs were estimated to be approximately $1,374,135 based on a 4% discount rate.

Table Q-1
Closure Cost Estimate

O&M Cost Item	Quantity	Units	Unit Cost	Total Cost	Notes
Topographical Site Survey	1	EA	$ 5,000	$ 14,998	every 5 years, 4% discount rate - last performed in 2019
Sump Pumping and Monitoring	167,868	GAL	$ 2.46	$ 340,171	Frequency varies over time, total of 12 years of pumping, 4% discount rate
Groundwater Monitoring					
Reporting	1	EA	$ 20,000	$ 339,655	annually for 26 years, 4% discount rate, assumes $6K for data validation; $14k for report
Field Collection and Analysis	1	EA	$ 30,000	$ 509,483	annually for 26 years, 4% discount rate, assumes $15K for field collection; $15k for analysis
Annual Weed Control					
Pre-emergent and post-emergent spray slopes	1	EA	$ 5,000	$ 84,914	Annually for 26 years, 4% discount rate
Annual Storm Inspections and Repairs	1	LS	$ 5,000	$ 84,914	Annually for 28 years, 4% discount rate, assumes no major erosion or drainage structure failure due to 100 year rain event or greater occurrence
TOTAL ESTIMATED O&M COST				**$ 1,374,135**	

Note: Post-closure period began on 1 July 2015 with NDEP's acceptance of the final Phase V CQA Report.

Attachment R
Financial Assurance

Attachment R

Financial Assurance

Basic Remediation Company (BRC)

Corrective Action Management Unit (CAMU)

Henderson, Nevada

The mechanism for financial assurance for the entire cleanup project, which includes post-closure costs associated with the CAMU itself, is the attached CAMU bond #1099778.

[Placeholder for CAMU Bond]

Attachment S
Sudden and Non-sudden Insurance Documentation

Attachment S

Sudden and Non-sudden Insurance Documentation

Basic Remediation Company (BRC)

Corrective Action Management Unit (CAMU)

Henderson, Nevada

Provisions for insurance including sudden and non-sudden insurance coverage for the entire cleanup project are provided in the attached declarations for insurance policy #7983-43-09.

To the extent the attached policy does not provide insurance coverage for sudden and non-sudden accidental occurrences, BRC maintains additional policies which cover sudden and non-sudden accidental occurrences for the entire cleanup project. These policies substantively conform with the requirements contained in the CFR. BRC warrants that, as contained and defined in the policies, the "landfill areas" include the CAMU. BRC further warrants that its remaining allocated coverage limits meet the required amounts set forth in the CFR ($3,000,000/$6,000,000). BRC further warrants that the policies will be in place prior to final closure of the CAMU or so long as leachate tanks are located at the CAMU.

If, at any time while this Permit is active and prior to final closure of the CAMU, the amount of BRC's coverage limits dip below the required amounts, or if BRC learns of any information which would adversely affect these policies coverage of sudden and non-sudden accidental occurrences with respect to this Permit, BRC will inform NDEP and provide alternative coverage immediately.

2.5 Biennial Reports.....T-3
3.0 Post CAMU Closure Reporting and Recordkeeping T-3

1.0 INTRODUCTION

Records of data, drawings and calculations concerning work proposed or completed at the BRC CAMU will be kept on permanent file in the BRC Data Repository, consistent with document retention requirements specified in the AOC3. In addition, records will be maintained at the BRC offices in conjunction with investigative work at the BRC CAMU. Included in the reports will be appendices with copies of data sheets, log books, and laboratory analysis results. All investigative results will be incorporated into the reports detailed in the following section.

Prior to any document destruction, NDEP will be provided an opportunity to acquire the documents in question.

2.0 OPERATIONAL RECORDKEEPING AND REPORTS

2.1 Training Records

BRC will maintain records of training received by onsite workers. These records will include copies of certificates received prior to BRC CAMU site activities and site specific training received. The training records will be stored onsite at the facilities maintained by BRC. Records will be maintained onsite for a period consistent with that specified in the AOC3.

2.2 Operational Records

ENTACT prepared daily progress reports documenting daily BRC CAMU activities. Daily activity records included, but were not limited to, documentation that evidences the quantity of waste materials placed in the BRC CAMU and log in/out forms. In addition to this summary daily report, ENTACT kept detailed field notes and daily logs documenting:

- the date, project name, location, and other identification;
- a summary of the weather conditions;
- a summary of locations where construction is occurring;
- equipment and personnel on the project; and
- a summary of meetings held and attendees.

Daily photographic and video record will be kept by BRC documenting disposal activities. Records and results of inspections will be maintained and kept onsite for a period consistent with the AOC3.

Records and results of waste analysis and waste determinations will be maintained and kept at the BRC Offices. In addition, monitoring, testing, or analytical data, and corrective action records resulting from BRC CAMU releases will be maintained for three years. Groundwater monitoring and clean up records will be maintained in accordance with records retention requirements outlined in AOC3.

Summary reports of incidents that require the use of the Contingency Plan will contain the details outlined in Attachment G, Accident Prevention, Contingency, and Emergency Response Plan. The incident reports will be maintained and kept onsite until completion of the post-closure period for the BRC CAMU.

Additional items to be included with the operating records are: post-closure cost estimates, plans for post-closure, EPA identification number, detailed chemical and physical analysis of a representative waste sample, Quality Control (QC) and Quality Assurance (QA) documentation.

2.2.1 Construction Quality Control and Quality Assurance

Geosyntec prepared daily reports that document the activities observed during each day of activity as detailed in the CQA Plan (Section 10 in the SRAPI). The daily reports included monitoring logs and testing data sheets. At a minimum, these logs and data sheets included the following information:

- a description of materials used and references of results of testing and documentation;
- identification of deficient work and materials;
- results of re-testing corrected "deficient work;"
- an identifying sheet number for cross referencing and document control;
- descriptions and locations of construction inspected;
- type of construction and inspection performed;
- description of construction procedures and procedures used to evaluate construction;
- a summary of test data and results;
- calibrations or re-calibrations of test equipment and actions taken as a result of re-calibration;
- decisions made regarding acceptance of units of work and/or corrective actions to be taken in instances of substandard testing results;
- a discussion of agreements made between the interested parties which may affect the work; and
- signature of the respective CQA Site Manager.

CQA Results are included in the CQA Reports (SRAPI Sections11 through 21).

2.3 Interim Status Reports

During remediation activities at the Site, BRC submitted monthly status reports to the NDEP. The purpose of the monthly status reports was to keep the NDEP informed of the progress of remediation activities at the Site.

2.4 Annual Reports

BRC submitted an annual report of the solid wastes received at the site to the NDEP. This report was submitted in a format mutually agreed to between BRC and NDEP. The report consisted of data reported in units of tons and cubic yards for waste materials received at the BRC CAMU.

The annual report was submitted to NDEP and included data compiled throughout the year. The total quantity of wastes deposited and the remaining capacity of the BRC CAMU in cubic yards was incorporated. In addition, the leachate quality data was compiled and the status of the leachate collection, including quantity of leachate collected on-site and disposed on a monthly basis, reported. Finally, any changes from the approved report, plans, and specifications, with justifications.

2.5 Biennial Reports

BRC submitted the biennial report by March 1 of each even year to the NDEP on EPA form 8700-13B. The report summarized activities at the BRC CAMU for the previous two years. The report contained: EPA identification number, BRC CAMU address, dates covered, description of wastes received, method of waste disposal, most recent closure and post-closure cost estimates, methods utilized to reduce waste volume, and any changes in waste volumes. This report was signed by BRC.

3.0 POST CAMU CLOSURE REPORTING AND RECORDKEEPING

Maintenance inspection records will be kept and maintained in a log book in order to clearly document changes in physical conditions. Copies of the inspection report will be provided to the NDEP annually.

Results of monitoring will be kept and maintained onsite for a period of at least 30 years after closure. Copies of the monitoring reports, including leachate management and monitoring, will be provided to NDEP with the inspection report annually.

The condition of the facility will be documented with field notes, maps, and photographs, as appropriate. Evidence of potential compromises in the cover will be recorded including eroded patches, patches of dead vegetation, animal burrows, subsidence, and cracks along the cover. Surface water drainage features will be inspected for the presence of debris, physical integrity, and evidence of conditions that exceeded design assumptions.

Compliance with Applicable Federal Laws

Basic Remediation Company (BRC)

Corrective Action Management Unit (CAMU)

Henderson, Nevada

Table of Contents

1.0	Introduction	U-1
1.1	The Wild and Scenic Rivers Act	U-1
1.2	The National Historic Preservation Act of 1966	U-1
1.3	The Endangered Species Act	U-2
1.4	The Coastal Zone Management Act	U-2
1.5	The Fish and Wildlife Coordination Act	U-3

1.0 INTRODUCTION

This attachment discusses how the BRC CAMU is in compliance with the following Federal Laws.

1.1 The Wild and Scenic Rivers Act

The Wild and Scenic Rivers Acts protects river areas and their immediate environments for the present and future generations. Rivers are eligible for protection if they display one or more of the following characteristics:

1. *Wild river areas* -- Those rivers or sections of rivers that are free of impoundments and generally inaccessible except by trail, with watersheds or shorelines essentially primitive and waters unpolluted. These represent vestiges of primitive America.

2. *Scenic river areas* -- Those rivers or sections of rivers that are free of impoundments, with shorelines or watersheds still largely primitive and shorelines largely undeveloped, but accessible in places by roads.

3. *Recreational river areas* -- Those rivers or sections of rivers that are readily accessible by road or railroad, that may have some development along their shorelines, and that may have undergone some impoundment or diversion in the past.

There are no rivers in the vicinity of the BRC CAMU site with the exception of the Las Vegas Wash which is approximately 2 miles north of the Site, and the Las Vegas Wash is not designated as a Wild and Scenic River.

1.2 The National Historic Preservation Act of 1966

The National Historic Preservation Act protects, rehabilitates, restores and reconstructs the districts, sites, buildings, structures, and objects significant in American history, architecture, archaeology, or culture.

There are no locations of historical significance at the BRC CAMU site. BRC contacted the Nevada Natural Heritage Program and requested a search of their database. No locations of historical significance were identified as a result of this search. A copy of the search result is provided in Appendix A to this Attachment.

1.3 The Endangered Species Act

The city of Henderson, along with other cities within Clark County, submitted an application to the EPA for a permit to incidentally take desert tortoises (*gopherus agassizii*), pursuant to section 10(a)(1)(B) of the Endangered Species Act of 1973, as amended (Act), in association with various proposed public and private projects in Clark County, Nevada. The permit allows incidental take of desert tortoises for a period of 30 years, resulting from development on up to 113,900 acres of private lands within Clark County, Nevada. The permit application was received September 28, 1994, and was accompanied by the Clark County Desert Conservation Plan (CCDCP), which serves as the Applicant's habitat conservation plan and details their proposed measures to minimize, monitor, and mitigate the impacts of the proposed take on the desert tortoise.

To minimize the impacts of take, Henderson provides a free pick-up and collection service for desert tortoises encountered in harm's way within the city. These desert tortoises will be made available for beneficial uses such as translocation studies and programs, research, education, zoos, museums, or other programs approved by the Service and Nevada Division of Wildlife. Sick or injured desert tortoises will be humanely euthanized.

Henderson approves the issuance of land development permits for otherwise lawful public and private project proponents during the 30-year period in which the proposed Federal permit is in effect. Henderson imposes a fee of $550 per acre of habitat disturbance to fund the measures to minimize and mitigate the impacts of the proposed action on desert tortoises.

The BRC CAMU complied with the Endangered Species Act through a fee of $550 per acre submitted with the grading permit application. No Desert Tortoise were encountered during construction.

The above discussion notwithstanding, BRC does not believe that there are any threatened and endangered species in the CAMU area. BRC requested that Nevada Natural Heritage conduct a search related to such species. The letter from Nevada Natural Heritage provided in Appendix A to the Attachment confirms that there are no at risk taxa in this area.

1.4 The Coastal Zone Management Act

The Coastal Zone Management Act seeks to manage and preserve the nation’s coastal resources, ensuring their protection for future generation.

The BRC CAMU site is not located near any coasts.

1.5 The Fish and Wildlife Coordination Act

The Act provides that whenever the waters or channel of a body of water are modified by a department or agency of the U.S., the department or agency first shall consult with the U.S. Fish and Wildlife Service and with the head of the agency exercising administration over the wildlife resources of the state where construction will occur, with a view to the conservation of wildlife resources. The Act provides that land, water and interests may be acquired by federal construction agencies for wildlife conservation and development. In addition, real property under jurisdiction or control of a federal agency and no longer required by that agency can be utilized for wildlife conservation by the state agency exercising administration over wildlife resources upon that property.

The BRC CAMU did not modify the waters or channel of a body of water.

Henderson, NV 89011

RE: Data request received 23 February 2007

Dear Mr. Sahu:

We are pleased to provide the information you requested on endangered, threatened, candidate, and/or At Risk plant and animal taxa recorded within or near the BRC Common Areas-CAMU Project area. We searched our database and maps for the following a 5 kilometer radius around including:

Township 22S Range 62E Sections 11 and 12

There are no at risk taxa recorded within the given area. However, habitat may be available for: the big free-tailed bat, *Nyctinomops macrotis*, a Nevada Bureau of Land Management (BLM) Sensitive Species; the spotted bat, *Euderma maculatum*, a Nevada BLM Special Status Species; the Arizona toad, *Bufo microscaphus*, a Nevada BLM Sensitive Species; the desert tortoise, *Gopherus agassizii*, a Federally Threatened Taxon; the chuckwalla, *Sauromalus ater*, a Nevada BLM Sensitive Species; and the banded Gila monster, *Heloderma suspectum cinctum*, a Nevada BLM Special Status Species. We do not have complete data on various raptors that may also occur in the area; for more information contact Ralph Phenix, Nevada Division of Wildlife at (775) 688-1565. Note that all cacti, yuccas, and Christmas trees are protected by Nevada state law (NRS 527.060-.120), including taxa not tracked by this office.

Please note that our data are dependent on the research and observations of many individuals and organizations, and in most cases are not the result of comprehensive or site-specific field surveys. Natural Heritage reports should never be regarded as final statements on the taxa or areas being considered, nor should they be substituted for on-site surveys required for environmental assessments.

Thank you for checking with our program. Please contact us for additional information or further assistance.

Sincerely,

Eric S. Miskow
Biologist III/Data Manager

Carson City, Nevada 89701

Ref: Application for Renewal of the BRC CAMU

Dear Mr. Leigh

BRC hereby submits the attached renewal application for the BRC CAMU located in Henderson, NV. The current permit, which was issued on September 24, 2007, expires on September 24, 2012. We are submitting this renewal application for a new 5-year term.

The BRC CAMU was constructed in Phases, per the original NDEP-approved design. The CAMU consists of Phases I, II, IIIA, IIIB, IV, and V. All work in the field to close the CAMU is complete. Submittal and approval of the Final Closure III CQA Report documenting the closure construction of Phase V is pending. When approved, the entire CAMU construction will be complete and the entire closed CAMU will be in inspection and maintenance.

Related activities also completed to date include capping the contiguous, the majority of the existing BMI North and all of the existing BMI South landfills, with approval by the NDEP.

Since the next term of the RAP will consist of activities that are similar to the current term, we have retained construction and closure related documents in this application, updating only as needed to reflect current conditions. We have kept the format of this application consistent with the prior application for ease of review, including prior

Attachment numbering. When relevant we have revised existing Attachments and/or provided new Attachments.

Specifically, with regards to final design drawings, for ease of reference and in order to avoid a substantial effort associated with reissuance of drawings that have already previously been approved by the NDEP, instead of separating out the design documents just for Phase V, we have provided the entire set of final design documents in this application.

With regards to groundwater monitoring please note that we are currently in negotiations with the NDEP Bureau of Corrective Actions (BCA) with regards to the Long Term Groundwater Monitoring Plan for the CAMU. We have a placeholder Attachment for this Plan (Attachment Y) which will be submitted once discussions with the BCA are completed.

With regards to future land use on the final cover of the CAMU, as the NDEP is aware, a solar collection field is planned for installation. This system will be installed and maintained by a party other than BRC, subject to a land lease agreement with BRC. The land lease between BRC and the parties will include all applicable conditions of the RAP. Whomever the solar operator may be, they will separately obtain the necessary approvals and permits to install and operate the solar field (including such permits as may be necessary from the NDEP), BRC's CAMU design engineer Geosyntec will review any proposed design to ensure it is in conformance with the CAMU cover design (Attachment AA). Attachment AA provides guidance to any solar field design for the installation and operation of a Solar field. Attachment AB provides a placeholder in which the details of the solar field design documents are located. Currently, this includes documents which have been submitted to the NDEP for review.

It is BRC's understanding, based on conversations with the NDEP, that there is no special format for this application and no forms, etc. as such. As noted above, we have updated the application materials as needed, based on relevance going forward.

Finally, we request that the NDEP issue the revised RAP, deleting conditions in the current version that are no longer appropriate for the next term.

Should you have any questions, please call me at 702.567.0400.

Mr. Lee C. Farris, P.E.
Vice-President

1.0 INTRODUCTION

Basic Remediation Company (BRC) has prepared and submits this application for the renewal of the current Remedial Action Plan (RAP) permit (Attachment W) to construct and operate a Remediation Waste Management System (RWMS) in Clark County, Nevada. A previous version of this document was submitted to the Nevada Division of Environmental Protection (NDEP) in March 2007 by BRC's design engineer Geosyntec Consultants. This document includes the application and supporting documentation for a proposed Corrective Action Management Unit (CAMU), hereafter referred to as the BRC CAMU. This permit application is being submitted to the NDEP, Carson City, Nevada.

This application provides the information needed to obtain a RAP as specified in 40 CFR 270, Subpart H. In this context, a RAP is defined as a special form of RCRA permit that authorizes the disposal of remediation waste at a remediation waste management site. This type of permit was developed as part of the Hazardous Waste Identification Rule for Contaminated Media, or "HWIR-media rule" (63 FR 65874). As stated in the United States Environmental Protection Agency (USEPA) Environmental Fact Sheet on the Final HWIR-Media Rule (EPA530-F-98-029), this rule is designed to eliminate existing regulatory disincentives to remediation, make site cleanup faster and easier, and, thus, provide increased protection to human health and the environment.

As described in the previous application, the proposed disposal facility will continue to only receive remediation waste. The proposed unit is conservatively designed to meet the regulatory requirements for a CAMU, as referred to in 40 CFR 264.552.

As noted in the prior application, the purpose of the BRC CAMU is to provide a permitted disposal facility at the NDEP-approved location (per the Record of Decision dated 2 November 2001) for wastes generated during the voluntary cleanup of certain areas of the BMI Common Areas (the "Site"), as specifically contemplated by the "Nevada Division of Environmental Protection Settlement Agreement and Order on Consent: BMI Common Areas, Phase 3" (the "AOC3") dated February 15, 2006, and as defined in the Corrective Action Plan (CAP) (BRC, 2006). Portions of the Site have been impacted during the legal disposal of various materials, including industrial wastes and cooling waters. The NDEP provides oversight of the voluntary cleanup activities. As a result of the NDEP's review of the "Remedial Alternatives Study (RAS) for the BMI Common Areas" (ERM, 1999), and subsequent discussion with BRC, the location

stated in remedial alternative 4B was approved as the preferred location of waste materials generated from the voluntary cleanup of the Site. The actual text of the NDEP's comment is provided below for reference.

> "Per discussions with Basic Remediation Company (Robin Bain) on August 5, 1999, the Division assumes this alternative (4B in the RAS) has been modified to locate soils within the confines of BMI property immediately surrounding the current BMI Landfill. Based on currently available information, co-location of impacted soils with the BMI Landfill is the current preference of the Division for soil disposal."

The BRC CAMU was constructed in Phases, per the original NDEP-approved design. The CAMU consists of Phases I, II, IIIA, IIIB, IV, and V. All but Phase V have already been constructed with waste placement and closure completed for Phases I, II, IIIA, IIIB, and IV. The following Construction Quality Assurance (CQA) Reports for these Phases were submitted to NDEP and approved:

- Phase I Construction Quality Assurance Report, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated September 2008. (Phase I Liner CQA Report)
- Phase II Construction Quality Assurance Report, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated December 2008. (Phase II Liner CQA Report)
- Phase IIIA Construction Quality Assurance Report, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated March 2009. (Phase IIIA Liner CQA Report)
- Phase IIIB Construction Quality Assurance Report, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated May 2009. (Phase IIIB Liner CQA Report)
- Phase IV Construction Quality Assurance Report, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated July 2009. (Phase IV Liner CQA Report)
- Phase V Construction Quality Assurance Report, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated September 2009. (Phase V Liner CQA Report)

The following Closure documents for these Phases were submitted to the NDEP and approved:

- CAMU Partial Final Closure Construction Quality Assurance Report, Phases IIIA & Portion of Phase II, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated April 2010. (Closure I CQA Report)
- CAMU Partial Final Closure Construction Quality Assurance Report, Phases I, IIIB, IV, & Portions of Phases II and V, Basic Remediation Company, Corrective Action Management Unit, Henderson, Nevada prepared by Geosyntec Consultants, Inc. dated May 2010. (Closure II CQA Report)

As such, ongoing activities for these Phases consist of inspection and maintenance.

Final closure construction is complete for Phase V and submittal and approval Final Closure III CQA Report documenting this closure construction is pending. When approved, the entire CAMU construction will be complete and the entire closed CAMU will be in inspection and maintenance.

Since the next term of the RAP will consist of activities that are similar to the current term, we have retained construction and closure related documents in this application, updated as needed to reflect current conditions. We have kept the format of this application consistent with the prior application for ease of review, including prior Attachment numbering. When relevant we have revised existing Attachments and/or provided new Attachments.

Specifically, with regards to final design drawings, for ease of reference and in order to avoid a substantial effort associated with reissuance of drawings that have already previously been approved by the NDEP, instead of separating out the design documents just for Phase V, we have provided the entire set of final design documents in this application.

With regards to groundwater monitoring please note that we are currently in negotiations with the NDEP Bureau of Corrective Actions (BCA) with regards to the Long Term Groundwater Monitoring Plan for the CAMU. We have a placeholder Attachment for this Plan (Attachment Y) which will be submitted once discussions with the BCA are completed.

With regards to future land use on the final cover of the CAMU, as the NDEP is aware, a solar collection field is planned for installation. This system will be installed and maintained by a party other than BRC, subject to a land lease agreement with BRC. The land lease between BRC and the parties will include all applicable conditions of the RAP. Whomever the solar operator may be, they will separately obtain the necessary approvals and permits to install and operate the solar field (including such permits as may be necessary from the NDEP), BRC's CAMU design engineer Geosyntec will review any proposed design to ensure it is in conformance with the CAMU cover design (Attachment AA). Attachment AA provides guidance to any solar field design for the installation and operation of a Solar field. Attachment AB provides a placeholder in which the details of the solar field design documents are located. Currently, this includes documents which have been submitted to the NDEP for review.

It is BRC's understanding, based on conversations with the NDEP, that there is no special format for this application and no forms, etc. as such. As noted above, we have updated the application materials as needed, based on relevance going forward.

Finally, we request that the NDEP issue the revised RAP, deleting conditions in the current version that are no longer appropriate for the next term.

2.0 BACKGROUND

The BRC CAMU is located within Sections 11 and 12 of Township 22 South, Range 62 East, approximately 10,000 feet west-northwest of the intersection of Lake Mead Drive and Boulder Highway and approximately 3,500 feet west-southwest of intersection of Warm Springs Road and Boulder Highway (Attachment A). The site is approximately 13 miles south of the City of Las Vegas. The BRC CAMU is located within the boundaries of the BMI Common Areas and is bordered on the north, east, and south by the BMI Industrial Complex. The BMI Industrial Complex consists of four operational plants west of Boulder Highway and north of Lake Mead Drive.

The BRC CAMU, which is approximately 55 acres, is located within a 113-acre area northwest of the active plant area of the BMI Complex (Attachment B). The separate, distinct, and existing BMI Landfills (BMI North and BMI South)occupy approximately 66 acres of this area and was initially used as effluent disposal ponds for the Basic Magnesium, Inc. magnesium refinery since its inception. Following shut-down of the refinery in November 1944, the two western-most ponds were converted to a solid waste disposal area which became known as the BMI Landfill. Use of this Landfill continued by successor operations until its closure in February 1980. As part of the current RAP, BRC has completed the closure and capping of Phases I, II, IIIA, IIIB, IV, and a portion of Phase V of the CAMU, and the entire BMI south Landfill a portion of the BMI North Landfill (Attachment X).

Immediately to the south of the BMI North Landfill, a series of slit trenches were excavated during the 1950s through 1970s. A range of refuse and industrial wastes were placed into these slit trenches, the use of which was discontinued prior to 1980. Under NDEP oversight, these wastes have been removed and placed within the CAMU in Phases II, IIIB, and IV as part of the construction of these Phases under the terms of the current RAP.

3.0 OVERVIEW

Since Phase V of the CAMU and a portion of the BMI North Landfill have not been closed, we have retained this section consistent with the previous version of this application.

This permit application addresses the requirements for a RAP, as specified in 40 CFR 270. Table 1 of this permit application includes introductory material and

citations of where each regulatory requirement is addressed in this application package. Attachment I contains site location information. Attachment R provides documentation of financial assurance.

Plans relating to Waste Characterization, Monitoring Programs, and Post-Closure are presented in Attachments C, N, and O respectively. The final design documents for the BRC CAMU are provided in Attachment K. Attachment C also includes a general discussion of the waste material to be disposed of in the remaining portions of the CAMU Phase V as well as provides summary tables of analytical data for these waste source areas.

A geotechnical evaluation of the site is presented in Section 8 of the SRAPI. The geotechnical study encompasses the proposed landfill (Borings B1 through B-12 and B-102) and Basic Environmental Company (BEC) property immediately to the west and northwest of the proposed landfill. In addition, boring logs for recent slit trench investigation work are presented in Section 8 of the SRAPI.

Attachment O includes discussion of the BRC CAMU Closure Plan with conceptual design parameters for the final cover along with supporting infiltration modeling information and conceptual design of the Final Cover System.

It should be noted that a solar collection field is planned for installation on top of the cover. This system will be installed and maintained by a party other than BRC, subject to a land lease agreement with BRC. The land lease between BRC and the parties will include all applicable conditions of the RAP. Whomever the solar operator may be, they will separately obtain the necessary approvals and permits to install and operate the solar field (including such permits as may be necessary from the NDEP), BRC's CAMU design engineer Geosyntec will review any proposed design to ensure it is in conformance with the CAMU cover design (Attachment AA). Attachment AA provides guidance to any solar field design for the installation and operation of a Solar field. Attachment AB provides a placeholder in which the details of the solar field design documents are located. Currently, this includes documents which have been submitted to the NDEP for review.

4.0 REQUIRED INFORMATION

This section outlines the information required for a RAP application, as specified in 63 FR 65942 and 40 CFR 270.110. For those requirements that call for detailed explanation or the use of drawings, reference is provided to the appropriate section or drawing within this document. Table 1 is provided as an outline of applicable regulatory requirements, with references to pertinent sections of this RAP application.

The following is a list of the RAP application questions and associated responses:

(a) The name, address, and USEPA identification number of the remediation waste management site;

BRC CAMU, Clark County, 22S/62E/11 and 12; EPA ID# NVR000082255

(b) The name, address, and telephone number of the owner and operator;

Basic Remediation Company, 875 West Warm Springs Road, Henderson, Nevada; Phone: 702-567-0400

(c) The latitude and longitude of the site;

Latitude: 36D 02M 56.23S N (36.048953 decimal degrees)
Longitude: 115D 00M 47.51S W (-115.013197 decimal degrees)

(d) The United States Geological Survey (USGS), or county map, showing the location of the remediation waste management site;

The BRC CAMU site is located on the USGS Las Vegas SE, Nevada, Clark County quadrangle map. The site location is shown on Attachment A.

(e) A scaled drawing of the remediation waste management site showing:

1. The remediation waste management site boundaries;
2. Any significant physical structures; and
3. The boundary of all areas on-site where remediation waste is to be treated, stored, or disposed.

A scaled drawing showing all the required information is provided as Attachment B.

(f) A specification of the remediation waste to be treated, stored or disposed of at the facility or remediation waste management site. This must include information on:

1. Constituent concentrations and other properties of the remediation wastes that may affect how such materials should be treated and/or otherwise managed;

   Properties and constituent concentrations of the waste materials placed or to be placed in the BRC CAMU are provided in Attachment C of this document, entitled "Waste Analysis Plan".

2. An estimate of the quantity of these wastes; and

   As noted in Attachment C, the estimated quantity of waste material is approximately 3.7 million cubic yards. However, based on post-excavation confirmation sampling and removal of wastes from the remediation areas, the final quantity of waste materials will likely be around 4.1 million cubic yards.

3. A description of the processes you will use to treat, store, or dispose of this waste, including technologies, handling systems, design and operating parameters you will use to treat hazardous remediation wastes before disposing of them according to the Land Disposal Restrictions (LDR) standards of part 268 of this chapter, as applicable.

   The process to be used in handling and disposal of the waste is outlined in Attachments C through P of this RAP permit application.

(g) Enough information to demonstrate that operations that follow the provisions in your RAP application will ensure compliance with applicable requirements of parts 264, 266, and 268 of this chapter;

Table 1 is provided as an outline of the applicable regulatory requirements, with references to pertinent sections of this RAP application, which demonstrate compliance.

(h) Such information as may be necessary to enable the Regional Administrator to carry out his duties under other Federal laws, as is required for traditional RCRA permits under 270.14(b)(20);

This RAP permit application is intended to provide sufficient information to enable the Regional Administrator to carry out his/her duties under other Federal Law, as is required for traditional RCRA permits under 270.14(b)(20).

(i) Any other information the Director decides is necessary for demonstrating compliance with this subpart or for determining any additional RAP conditions that are necessary to protect human health and the environment.

This RAP permit application is intended to provide sufficient information regarding siting, design, and operation to determine compliance with RAP conditions that are necessary to protect human health and the environment.

1.0 INTRODUCTION

The Basic Remediation Company (BRC) site-related chemicals (SRC) list, as approved by the Nevada Division of Environmental Protection (NDEP), currently includes a wide range of analytes, including many chemicals with universal treatment standards (UTS), as defined in Code of Federal Regulations (CFR) Title 40, Chapter 268.48 (40 CFR 268.48). The UTS list, with those constituents on the BRC SRC list identified, is shown in Table C-1. All areas where wastes are present or may be present based on visual evidence and an understanding of the Conceptual Site Model (CSM), along with measured or anticipated waste depths, are shown on Figure C-1. Although additional remediation may be required in areas not shown in order to meet project risk goals, wastes are not present in discernable quantities in other areas; therefore, sampling in areas not shown as containing wastes in Figure C-1 would not provide a realistic representation of waste composition (i.e., any samples collected will be unavoidably diluted with non-waste soils, thus rendering them unrepresentative of waste materials). Although sporadic waste sampling efforts have been conducted in the past within the BMI Common Areas, the recent Waste Sampling and Analysis effort in 2006 was a systematic attempt to characterize the wastes present in the Common Areas. This recent round of sampling also utilized the final SRC list for the BMI Common Areas, thereby providing the largest number of analytes for analysis. Thus, this most recent sampling provides the most complete characterization of the wastes and is summarized in this Attachment. It should be noted, however, that since these waste sampling results reflect the condition of the wastes as they are present in the source areas, there is likely to be some unavoidable commingling of wastes and non-waste materials during removal actions leading to dilution – thus, the characteristics of the wastes prior to placement in the CAMU may therefore be somewhat different. In this respect the results presented and discussed in this Attachment are conservative.

2.0 INVESTIGATIVE HISTORY

The 2006 waste characterization investigation, pursuant to an approved workplan by NDEP, focused on areas within the BMI Common Areas (Eastside) where wastes are located. Each of the samples collected from these areas was a composite grab sample in order to provide a representative concentration of the wastes present. Details of this compositing approach are shown in Table C-2 and Figure C-2, and Figures C-3A through C-3C.

The methodology for the solid matrix samples and waste water sample were in accordance with the project Field Sampling and Standard Operating Procedures (FSSOP; BRC and MWH 2006a) for surface and subsurface soil sample collection, including pre-field activities. The project Health and Safety Plan (HSP; BRC and MWH 2005) and Quality Assurance Project Plan (QAPP; BRC and MWH 2006b) prepared for the BMI

Common Areas were also used for this work. All work was completed under the direction of a State of Nevada Certified Environmental Manager (CEM).

The vast majority of the wastes present are soils and sediments; however, for completeness BRC also sampled the only wastewater present – namely in the TIMET Pond SW-12. This pond and the other TIMET ponds are no longer in service and the free water contained therein are evaporating. The primary purpose of the sampling effort was to (a) complete characterization of the remedial wastes in order to address certain regulatory requirements pertaining to their anticipated excavation and placement into the proposed CAMU; and (b) to assist with continued development of the BMI Common Areas (Eastside) CSM.

Waste characterization was performed to determine whether excavated materials comply with minimum treatment requirements (MTRs) prior to placement into a land disposal unit. As such the Waste Sampling and Analysis Plan (BRC, 2006) that was prepared and approved by the NDEP, with incorporated comments, complied with and was intended to support regulations at 40 CFR 270.110(f); 40 CFR 264(1)(j)(2); 40 CFR 264.552(d); 40 CFR 264.552(e)(2)&(4); and 40 CFR 268.49 (U.S. Environmental Protection Agency [USEPA] 2005).

Samples were collected from the following areas:

- Alpha ditch: composite samples were collected from three locations along the length of the alpha ditch. Each of the three sample locations consisted of composite samples from three equidistant locations (50 feet apart) and from two depths each.

- Beta ditch: composite samples were collected from three locations along the length of the beta ditch. Each of the three sample locations consisted of composite samples from three equidistant locations (50 feet apart) and from three depths each.

- IRM soil holding ponds: a single composite sample was collected from each of the IRM holding ponds – these are seven of the Upper Ponds. Each IRM holding pond sample consisted of composite samples from two locations within the holding pond and from two depths each. Since these ponds are capped for dust mitigation purposes, the upper sampling interval was below the cap.

- Mohawk area: a single composite sample was collected which consisted of samples from ponds PUE-01, PUE-02, PUF-01, and PUF-02 collected from surface soils.

- No-build area: three composite samples were collected which consisted of samples from ponds within the no-build area footprint. Each no-build area sample consisted of composite samples from four to five ponds each (as discussed in Table C-2) collected from surface soils.

- Sunset North area: a single composite sample was collected which consisted of samples from ponds west of the no-build area (as discussed in Table C-2) collected from surface soils. These ponds have undergone previous IRM activities.

- Spray Wheel: two composite samples were collected which consisted of samples from ponds with sediments within the Spray Wheel area. Each Spray Wheel sample consisted of composite samples from three to four ponds (as discussed in Table C-2) collected from two depths each.

- TIMET abandoned test pit: a single composite sample was collected which consisted of two samples from within the test pit footprint and from two depths each.

- Former Espey Construction site: a single composite sample was collected which consisted of two samples from within the construction site footprint and from two depths each.

- Other TIMET debris areas: a single composite sample was collected which consisted of samples from four areas identified as debris or storage areas (other than TIMET ponds, test pit or Espey Construction site). The other debris composite sample consisted of one sample from each of the four locations and from two depths each.

- TIMET berms: four composite samples were collected from berms between each of the TIMET ponds. Each sample consisted of composite samples from three locations from two depths each. Although the berms have not received any TIMET wastes, they were constructed via grading of historic BMI ponds located in this area.

- TIMET OPW ponds: two composite samples were collected which consisted of samples from each OPW pond. Each OPW pond sample consisted of composite samples from six to eight ponds each collected from two depths each. Only two samples were collected since the nature of the OPW wastes deposited in these ponds is uniform. A separate sample was collected from OPW Pond #12 since TIMET used this pond for disposal of lime bottoms. A single composite sample was collected consisting of samples from two locations within this pond and from two depths each.

- TIMET ponds: a single composite sample was collected from each of the 16 TIMET ponds. Each TIMET pond sample consisted of two composite samples from within the pond collected from two depths each. In addition, a wastewater sample was collected from Pond SW-12.

- Upper ponds: composite samples were collected, which consisted of samples from each of first seven upper pond rows from ponds with sediment (one composite sample per row). Each upper pond sample consisted of composite samples from four to six ponds each (as discussed in Table C-2) collected from two depths each.

Field sampling was conducted from July 26 through August 9, 2006. Through this effort, 53 soil samples and one sediment sample were collected for analyses, which were composited from 300 individual sample locations. A separate Data Validation

Summary Report (Dataset #39) was prepared and submitted to NDEP (BRC and MWH 2006c). This report was approved by the NDEP in November 2006. This report contains an electronic version of the waste characterization sampling database. Table C-3 summarizes the results of this investigation.

Table C-5 shows the estimated impacted soil volumes associated with the various waste areas. Figure C-4 shows the waste area locations.

3.0 RESULTS

A summary of the results of the waste sampling and analysis is provided in Table C-4. This table presents the minimum and maximum detected concentrations for each of the SRCs with a listed UTS, as defined in 40 CFR 268.48. The chemical-specific UTS times 10 and the chemicals that have been detected in concentrations that exceed 10 times their UTS are also indicated in Table C-4. Those chemicals with maximum concentrations that exceed 10 times their UTS are also compared to: 1) a potential carcinogenic direct risk from ingestion or inhalation at the site at or above 10^{-3}, and 2) a non-carcinogenic direct risk from ingestion or inhalation at the site an order of magnitude or greater over their reference dose. As discussed by USEPA (2002), hazard quotients are used as a measure of unacceptable exposure to constituents that produce toxic endpoints other than cancer.

USEPA Region 9 preliminary remediation goals (PRGs) tables provide exposure pathway-specific risk-based comparison values (USEPA 2004). These tables provide values for both carcinogenic and non-carcinogenic risks. If a particular chemical has both carcinogenic and non-carcinogenic toxicity criteria, these tables provide values for both these endpoints. Therefore, USEPA Region 9 residential PRGs for both carcinogenic and non-carcinogenic risks for the combined ingestion and inhalation exposure pathways were used in this analysis. Because PRGs for carcinogens are based on a cancer risk level of 10^{-6}, the values in the PRG tables were multiplied by 1,000 to obtain a 10^{-3} risk level. PRGs for non-carcinogens, which are based on a hazard quotient of 1, were multiplied by 10. These adjusted PRG values are shown in Table C-4 for those chemicals that exceeded 10 times their UTS. These chemicals were 2,4'-DDE, 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, beta-BHC, 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,6,7,8-HpCDF, 1,2,3,4,7,8,9-HpCDF, OCDD, and OCDF. Because PRG values were not available for 2,4'-DDE, values for 4,4'-DDE were used as a surrogate. PRG values for each of the dioxin congeners were obtained by multiplying the PRG for 2,3,7,8-TCDD by each congener's respective toxicity equivalency factor (TEF). All of the chemicals are considered carcinogens and have PRGs for carcinogenic risks. 4,4'-DDT and beta-BHC also have PRGs for non-carcinogenic risks. As indicated in Table C-4, none of these chemicals equal or exceed either a potential carcinogenic direct risk from ingestion or inhalation of 10^{-3}, nor a non-carcinogenic direct risk from ingestion or inhalation an order

of magnitude or greater over their reference dose. Therefore, all of the waste materials in the Eastside meet the UTS/MTR requirements.

Area / Sample ID	Spatial Composite	Depth Composite
Alpha Ditch		
WC-AD01*	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0 and 2 feet bgs
WC-AD02	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0 and 2 feet bgs
WC-AD03	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0 and 2 feet bgs
Beta Ditch		
WC-BD01	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0 , 6, and 11 feet bgs
WC-BD02	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0, 4, and 8 feet bgs
WC-BD03	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0, 4, and 8 feet bgs
IRM Soil Holding Areas		
WC-IM01	composite of 2 samples collected from IRM soil holding area in pond PUA-04	composite of samples collected from 2 and 4 feet bgs
WC-IM02	composite of 2 samples collected from IRM soil holding area in pond PUB-04	composite of samples collected from 2 and 4 feet bgs
WC-IM03	composite of 2 samples collected from IRM soil holding area in pond PUB-05	composite of samples collected from 2 and 4 feet bgs
WC-IM04	composite of 2 samples collected from IRM soil holding area in pond PUB-10	composite of samples collected from 2 and 4 feet bgs
WC-IM05	composite of 2 samples collected from IRM soil holding area in pond PUC-03	composite of samples collected from 2 and 4 feet bgs
WC-IM06	composite of 2 samples collected from IRM soil holding area in pond PUC-04	composite of samples collected from 2 and 4 feet bgs
WC-IM07	composite of 2 samples collected from IRM soil holding area in pond PUD-03	composite of samples collected from 2 and 4 feet bgs
Mohawk Area		
WC-MH01	composite of one sample each from ponds PUE-01, PUE-02, PUF-01, and PUF-02	composite of samples collected from 0 feet bgs
No-Build Area		
WC-NB01	composite of one sample each from ponds PLH-01, PLI-01, PLI-02, PLJ-01, and PLJ-02	composite of samples collected from 0 feet bgs
WC-NB02	composite of one sample each from ponds PLH-02, PLH-03, PLH-04, and PLI-03	composite of samples collected from 0 feet bgs
WC-NB03	composite of one sample each from ponds PLG-02 through PLG-05	composite of samples collected from 0 feet bgs
Sunset North Area		
WC-SN01	composite of one sample each from ponds PLD-10, PLE-08, PLE-09, PLF-05 through PLF-08, and PLG-06	composite of samples collected from 0 feet bgs
Spray Wheel		
WC-SW01	composite of one sample each from ponds PUE-08, PUE-09, PUF-08, and PUF-09	composite of samples collected from 0 and 2 feet bgs
WC-SW02	composite of one sample each from ponds PUF-07, PUG-08, and PUH-07	composite of samples collected from 0 and 2 feet bgs
Former Espey Construction Site		
WC-TE01	composite of two samples from footprint of former Espey Construction site	composite of samples collected from 0 and 2 feet bgs
Other TIMET Debris Areas		
WC-TD01	composite of one sample each from footprint of three other TIMET debris areas	composite of samples collected from 0 and 2 feet bgs
TIMET Abandoned Test Pit		
WC-TA01	composite of two samples from footprint of TIMET Abandoned Test Pit	composite of samples collected from 0 and 3 feet bgs

TABLE C-2
WASTE CHARACTERIZATION COMPOSITE SAMPLING
(Page 2 of 2)

Area / Sample ID	Spatial Composite	Depth Composite
TIMET Berms		
WC-TB01	composite of 3 equispaced samples from western berms between TIMET ponds	composite of samples collected from 0 and 2 feet bgs
WC-TB02	composite of 3 equispaced samples from central west berms between TIMET ponds	composite of samples collected from 0 and 2 feet bgs
WC-TB03	composite of 3 equispaced samples from central east berms between TIMET ponds	composite of samples collected from 0 and 2 feet bgs
WC-TB04	composite of 3 equispaced samples from eastern berms between TIMET ponds	composite of samples collected from 0 and 2 feet bgs
TIMET OPW Ponds		
WC-TW01	composite of one sample each from ponds OPW-6 through OPW-11	composite of samples collected from 0 and 3 feet bgs
WC-TW02	composite of one sample each from ponds OPW-13 through OPW-20	composite of samples collected from 0 and 3 feet bgs
WC-TW03	composite of two samples from pond OPW-12	composite of samples collected from 0 and 3 feet bgs
TIMET Ponds		
WC-TP01	composite of 2 samples from pond SC-1	composite of samples collected from 0 and 5 feet bgs
WC-TP02	composite of 2 samples from pond SW-2	composite of samples collected from 0 and 2 feet bgs
WC-TP03	composite of 2 samples from pond SW-3	composite of samples collected from 0 and 2 feet bgs
WC-TP04	composite of 2 samples from pond SW-4	composite of samples collected from 0 and 5 feet bgs
WC-TP05	composite of 2 samples from pond SW-5	composite of samples collected from 0 and 2 feet bgs
WC-TP06	composite of 2 samples from pond SW-6	composite of samples collected from 0 and 2 feet bgs
WC-TP07	composite of 2 samples from pond SW-7	composite of samples collected from 0 and 5 feet bgs
WC-TP08	composite of 2 samples from pond SW-8	composite of samples collected from 0 and 5 feet bgs
WC-TP09	composite of 2 samples from pond SW-9	composite of samples collected from 0 and 2 feet bgs
WC-TP10	composite of 2 samples from pond SW-10	composite of samples collected from 0 and 2 feet bgs
WC-TP11	composite of 2 samples from pond SW-11	composite of samples collected from 0 and 2 feet bgs
WC-TP12	composite of 2 samples from pond SW-12*	composite of samples collected from 0 and 2 feet bgs
WC-TP13	composite of 2 samples from pond HP-2	composite of samples collected from 0 and 2 feet bgs
WC-TP14	composite of 2 samples from pond HP-3	composite of samples collected from 0 and 2 feet bgs
WC-TP15	composite of 2 samples from pond HP-4	composite of samples collected from 0 and 2 feet bgs
WC-TP16	composite of 2 samples from pond HP-5	composite of samples collected from 0 and 2 feet bgs
Upper Ponds		
WC-UP01	composite of one sample each from ponds PUA-05 through PUA-10	composite of samples collected from 0 and 2 feet bgs
WC-UP02	composite of one sample each from ponds PUB-06 through PUB-09	composite of samples collected from 0 and 2 feet bgs
WC-UP03	composite of one sample each from ponds PUC-05 through PUC-08	composite of samples collected from 0 and 2 feet bgs
WC-UP04	composite of one sample each from ponds PUD-04 through PUD-09	composite of samples collected from 0 and 2 feet bgs
WC-UP05	composite of one sample each from ponds PUE-03 through PUE-07	composite of samples collected from 0 and 2 feet bgs
WC-UP06	composite of one sample each from ponds PUF-03 through PUF-06	composite of samples collected from 0 and 2 feet bgs
WC-UP07	composite of one sample each from ponds PUG-04 through PUG-07	composite of samples collected from 0 and 2 feet bgs

Note: Wastewater sample collected from TIMET Pond SW-12.

*Indicates BMI Siphon sample location.

1.0 INTRODUCTION

This Security Plan describes the procedures and barriers that will be used to prevent persons who are unaware of the danger from entering the Remedial Waste Management System (RWMS). In addition, this plan also includes measures to minimize the possibility of unauthorized entry by persons or livestock onto the active portion of the RWMS.

2.0 PERSONNEL-ACTIVE OPERATIONS

One or two full-time employees, not including contractor employees, will be onsite during construction operations. The following is a list of assigned personnel and their responsibilities:

- BRC – BRC will be on site for a portion of the time the site is open for waste disposal to oversee site operations. BRC will be responsible for keys and/or combinations to the site gates.
- Equipment Operators – The primary responsibility of these (two) positions is the normal construction and operational duties associated with the landfill operations, including spotting vehicles, spreading and compaction of waste material, landfill attendant duties, and installation of earthen cover. Equipment operators will report to BRC.
- Laborers – Typical duties will include site and roadway construction, maintenance, and cleanup, as determined by BRC. In addition, a minimum of one employee will be assigned the job of daily policing the site perimeter, providing directions to disposal locations, monitoring received waste and collecting management data. Laborers will report to BRC.

3.0 SITE CONTROL

3.1 Fencing and Gates

Primary site access will be gained through the entry gate located off Warm Springs Road on the west side of the property. The entry gate will be equipped with a lockable mechanism to prevent unauthorized entry and/or uncontrolled waste deposition when the site is closed. The gates will remain locked except during periods of continuous ingress/egress (i.e., during transport of materials to the BRC CAMU). Access to the site at points other than the entry gate will be discouraged by maintenance of site perimeter fencing during site operations. The Fence Plan is shown on Figure J-12 in Section 1 of the Supplemental RAP Information (SRAPI).

BRC will implement a monitoring program to identify and repair breaches in the perimeter fence line within a reasonable time frame. This program continues after final remediation completion.

3.2 Access

Access to the site will be controlled by site fencing during non-working hours and site personnel during working hours. In addition, artificial barriers will be used to protect public health, safety, and the environment. During specified working hours, waste materials approved for acceptance will be directed to the active landfill working face.

Additional site controls will be employed to control traffic flow, including pedestrian traffic, within the Site during remediation. These site controls are necessary to control remediation workers, vendors and subcontractors, and Site visitors. Site visitors will not be allowed to access the exclusion zone unless approved and escorted by authorized BRC representatives. Visitors will be allowed access if they provide proof of current Title 29 CFR.1910.120, they "sign in" as authorized visitors, and they attend a required Health and Safety tailgate briefing.

3.3 Signs

Bilingual Signs will be posted that clearly indicate the following:

- The owner and operator of the site;
- The hours of operation;
- Materials accepted or excluded; and
- The site is private property and is not open to the public for public disposal of any waste materials whatsoever.

At the main entrance gate off Warm Springs Road an easily visible sign will be posted indicating the facility name, and other pertinent information as required. The sign will include the name of the site operator, the operator's telephone number, and hours of operation. It will be noted on the signage that the BRC CAMU is a private operation.

Instructional signs will be placed at this site entrance addressing prescribed safety measures on the site and include instructions regarding prohibition of smoking within the disposal areas and mandating that all instruction from site personnel be obeyed.

Interior site haul roads will be appropriately signed so as to direct each load to its designated disposal area. Typical directional and information signs will be posted at the site. Location of signage may be changed from time-to-time to facilitate operations. In

addition, authorized personnel may be utilized to direct traffic at the active working face of the landfill operation.

Signs stating "Danger—Unauthorized Personnel Keep Out" will be posted at each entrance to the active portion of the facility, and at other locations, in sufficient numbers to be seen from any approach to the active portion of the site.

"No Trespassing" signs will be posted at each site entrance. Additional signs and/or measures may be required to protect personnel and public health and safety. All signs will be legible from a distance of at least 25 feet.

3.4 Lighting

Lighting will be provided at the main entrance to illuminate the gate and signs. During night time construction, temporary lighting will be used within areas of the site where work is being performed.

4.0 COMMUNICATION

Breaches in security will be reported to the BRC for immediate repair and correction.

On-site communication will be through mobile phones.

Appendices

Appendix A – Inspection Checklists

1.0 INTRODUCTION

This Inspection Plan includes the items, areas, units, and equipment that will be inspected during the construction and operation of the BRC CAMU to identify malfunctions, deterioration, operator errors, and discharges that may be causing, or may lead to, a release of waste constituents to the environment or a threat to human health. Inspections performed during the post-closure care period are discussed in Attachment O. This plan includes checklists, schedules, and qualifications of personnel charged to perform inspections. A separate Construction Quality Assurance (CQA) Plan for the construction of the base liner system is included in Supplemental RAP Information (SRAPI), Section 3 and a separate CQA Plan for the construction of the final cover system is included in SRAPI, Section 6.

BRC will inspect monitoring equipment, safety and emergency equipment, security devices, and operating and structural equipment (such as dikes and sump pumps) that are important to preventing, detecting, or responding to environmental or human health hazards. Inspection checklists will be kept on site and will identify the types of problems (e.g., malfunctions or deterioration) which are to be looked for during the inspection (e.g., inoperative sump pump, leaking fitting, erosion, etc.). Inspection checklists are included as Appendix A.

1.1 Personnel

To develop and maintain the overall BRC CAMU in conformance with the inspection standards outlined in this document, BRC employees and/or contractors will be assignedto site inspections. Other employees or contractors will be assigned, as needed, for support activities.

The following is a list of assigned personnel with a brief outline of their qualifications:

- BRC–BRC will maintain an office near the site. This individual will be directly responsible for all site-related inspection activities. The BRC shall assign inspection duties, ensure all activities are performed on schedule, and maintain records in accordance with this plan and the Reports and Recordkeeping Plan (Attachment T). This individual will report to the Project Manager.

- Equipment Operators – Employees serving in this capacity will possess experience and training in the fields of heavy equipment operation and earth movement and construction activities. The primary inspection responsibilities of

these positions include equipment and additional inspections as directed by the BRC. Equipment operators will report to the BRC.

- Laborer – Typical duties will include site and roadway construction, maintenance, and cleanup, as determined by BRC. One employee will be assigned the job of daily policing the site perimeter and regulation of site access, providing directions to disposal locations, monitoring received waste and collecting management data.

BRC is committed to placing and maintaining individuals with the overall training, experience, capabilities, and/or other qualifications in the above noted positions as necessary to operate and develop the site in such a manner as to meet or exceed applicable requirements and regulations. Additional equipment and personnel will be provided as required to accomplish overall site maintenance and operation standards, which equal or exceed all applicable State and local rules and regulations pertaining to site safety measures and the overall general protection of the area's environment.

2.0 OPERATIONAL INSPECTIONS

2.1 Health and Safety

Health and Safety inspections will be performed as outlined in the Accident Prevention, Contingency, and Emergency Response Plan (Attachment G). These inspections will be carried out by BRC or his/her designee. The Health and Safety inspections include verifying PPE and communication devices are in good, working condition, inspection of safe work practices, and verifying personnel has received proper health and safety training. If conditions are found to be unsafe through inspections, the Project Manager will halt work and address problems. Examples of unsafe conditions are: Personal Protective Equipment (PPE) or radio/communication malfunction, severe weather, and/or fire.

2.2 Air Monitoring

Given the small amount of additional waste to be placed in the CAMU, BRC does not plan to conduct any air monitoring. Of course, all dust suppression actions will continue to be implemented.

2.3 Hauling/Transport

Haul routes will be inspected on a daily basis by BRC or their designee during hauling operations. Condition of the haul routes will be evaluated daily to determine if repairs are required. Repairs will be made when rutting, drainage, or other issues impact the transport of the waste materials.

Hauling/transport equipment will be kept in good working order and will have covers over the load. Standard construction entrance features (rumble strips and large aggregate aprons) will be used to remove soil from vehicle wheels departing the BRC CAMU site. Sweeper and vacuum trucks will be used daily to maintain haul routes. Further details are found in the CAP.

2.4 Surface Water

BRC or his/her designee will be responsible for inspecting the storm water collection system after precipitation events (i.e. post storm) exceeding 1/4 inch in a 24 hour period and will evaluate erosion, sedimentation, and other damage, if any. In addition, the post storm inspection will be performed to evaluate the potential for surface water infiltration into the BRC CAMU. Surface water conveyance features will be inspected quarterly during the dry season and weekly during the wet season for sediment and debris accumulation. Collection and holding facilities will be inspected for sediment build-up and debris after precipitation events (i.e. post storm) exceeding 1/4 inch in a 24 hour period to maintain conveyance and design capacity.

Accumulated surface water, which has not entered the waste containing areas of the BRC CAMU, will be removed as soon as practical. An operational pump and appurtenant equipment will be maintained on-site during the entirety of the project (and not just during typically wet periods of the year) to be used in surface water removal. Accumulated surface water, which has contacted the waste material, will be treated as leachate and handled accordingly.

2.5 Leachate

Leachate monitoring will be conducted in accordance with the Final Leachate Monitoring Plan (Attachment Z). BRC

Leachate will be handled for proper disposal in accordance with BRC CAMU Operation Plan (Attachment M).

2.6 Gates and Fences

The BRC or designee will inspect the fences and gates routinely to ensure all are in proper working order. In addition, the security guard will note any missing or damaged signs around the property as well as evidence of unauthorized access. Damages will be recorded and repairs performed immediately to minimize unauthorized site access.

2.7 Liner and Cover Systems

During construction and installation, liners and cover systems will be inspected regularly for uniformity, damage, and imperfections (e.g., holes, cracks, thin spots, or foreign materials) as outlined in the construction quality assurance plans for the base liner system and final cover system. Details of liner and cover construction quality assurance are provided in the Construction Plan (Attachment L) and Closure and Post-Closure Plan (Attachment O), respectively. The liner system will be inspected weekly during waste placement activities to verify the system remains undamaged. If damage occurs, work activities in the area of the damage will halt while damage is repaired.

2.8 Equipment

During construction activities, all equipment in operation will be inspected daily by the equipment operator. BRC will also inspect and track on-site equipment to ensure that it is in good working order. Inspections will be performed by equipment operators to ensure equipment is in good working order. Equipment which is not in good working order will not be used until repaired or replaced.

2.9 Best Management Practices

Best management practices (BMPs) will be inspected weekly and after storm events to verify they are in good, working condition. If inspections indicate BMPs are damaged, they will be replaced.

3.0 RECORDKEEPING

BRC or their designee will record inspections in an inspection log. These records will be kept in accordance with the records retention requirements of the AOC3. At a minimum, these records will include the date and time of the inspection, the name of the inspector, a notation of the observations made, and the date and nature of any repairs or other remedial actions. Inspection checklists are included as Appendix A.

Appendix C – Organizational Flowchart

1.0 INTRODUCTION

This Personnel Training Plan describes the personnel and classroom or on-the-job training workers and other site personnel receive on how to perform their duties in a way that ensures the BRC CAMU complies with the conditions of this RAP and how to respond effectively to emergencies.

1.1 Personnel

To develop and maintain the overall BRC CAMU in conformance with the design and operational standards outlined in this document, three to four employees or contractors will be assigned, as required, to site operations. Other employees or contractors will be assigned, as needed, for support activities.

The following is a list of on-site personnel with a brief outline of their qualifications:

- BRC CAMU Construction Manager –BRC or their designee will be on site at least 50 percent (50%) of the time the site is open for waste disposal to oversee site operations. BRC will be responsible for keys to the site gates.
- Equipment Operators – The primary responsibility of these (two) positions is the normal construction and operational duties associated with the landfill operations, including spotting vehicles, spreading and compaction of waste material, landfill attendant duties, and installation of earthen cover. Equipment operators will report to BRC.
- Laborers – Typical duties will include site and roadway construction, maintenance, and cleanup, as determined by BRC. In addition, a minimum of one employee will be assigned the job of daily policing the site perimeter, providing directions to disposal locations, monitoring received waste and collecting management data. Laborers will report to BRC.

2.0 TRAINING

BRC is committed to placing and maintaining individuals with such overall training, experience, capabilities, and/or other qualifications in the above noted positions as necessary to operate and develop the site in such a manner as to meet or exceed applicable requirements and regulations. Additional equipment and personnel will be provided as required to accomplish overall site maintenance and operation standards, which equal or exceed all applicable State and local rules and regulations pertaining to site safety measures, and the overall general protection of the area's environment.

Non-office site personnel will receive 40-hr Occupational Safety and Health Administration (OSHA) Hazardous Waste Operations and Emergency Response Standards (HAZWOPER) training, which will be provided by certified trainers. Personnel will renew this training annually with the 8-hr refresher course. Employees using a Nuclear Density Gauge will be required to have completed the 8-hour Nuclear Density Safety Course, which will be provided by a certified trainer (e.g. Troxler Electronics, etc.). Prior to beginning work at the CAMU site, employees, contractors, and subcontractor personnel are required to submit all applicable training certificates to BRC to be maintained and stored in accordance with the Report and Record Keeping Plan (Attachment T). The task supervisor will be responsible for providing BRC with records of training. The following table lists the training required for specific work tasks and personnel working at the CAMU site. Select course descriptions are provided in Appendix A.

Work Task	Training	Personnel Required to be Trained	Documentation Required
All work at the CAMU site	40 hour OSHA HAZWOPER	All on-site personnel	Certificate from certified training meeting 29 CFR 1910
All work at the CAMU site	8 hour OSHA refresher	All on-site personnel	Certificate from certified training meeting 29 CFR 1910
All work at the CAMU site	8 hour OSHA Supervisor Training	On-site supervisors	Certificate from certified training meeting 29 CFR 1910
All work at the CAMU site	Respirator Fit Test	All on-site personnel	Certificate from certified trainer 29 CFR 1910
All work at the CAMU site	Red Cross First Aid and CPR	On-site supervisors	Certificate from Red Cross
Liner system – geomembrane installation	Manufacturer training on seaming geomembrane	Geomembrane installation technicians	Approval letter from geomembrane manufacturer
Liner system – geosynthetic material installation	Qualifications and experience installing similar materials	Geosynthetic material installation technicians	Qualifications and resumes of personnel responsible for installing geosynthetic materials
Soil/waste moisture / density testing	8 hour Nuclear Density Safety Training	CQA monitor testing fill and waste moisture / density	Certificate from certified trainer
Landfill operations management	SWANA Manager of Landfill Operations Training	Landfill manager	Certificate from certified SWANA trainer

HDPE pipe joining	Manufacturer Butt-Fusion Training	HDPE pipe joining technicians	Certificate from certified trainer

Additional site specific training will be conducted and recorded by task supervisors related to their work tasks. Site specific training is discussed in Section 2.2.

2.1 Construction Manager Training

In addition to OSHA 40-hr HAZWOPER Training, BRC will receive the OSHA 8-hr HAZWOPER Supervisor course. BRC or their designee will be responsible for providing a health and safety training for site personnel to become familiar BRC CAMU-specific procedures. BRC or their designee will keep records on names and dates of those who attended and passed training.

BRC or their designee will also be responsible for conducting pre-entry brief meetings and tailgate safety meetings. He/she will verify monitoring equipment and personal protective equipment is operational and will be responsible for verifying monitoring equipment has been calibrated. BRC will also be responsible for weekly inspections.

2.2 Equipment Operator and Laborer Training

In addition to OSHA 40-hr HAZWOPER training, employees shall receive BRC CAMU-specific training covering:

- Procedures for using, inspecting, repairing, and replacing facility emergency and monitoring equipment: Personnel receive instruction in the use of emergency and monitoring equipment described in the Attachment G. Personnel will be trained to inspect all facility emergency and monitoring equipment to mitigate the effects of equipment failure in the Inspection Plan. In addition, personnel will be trained in the use of emergency equipment in their job areas (e.g. fire extinguishers, respirators, etc.);
- Key parameters for equipment automatic shut-off: Plant and equipment operators will receive on-the-job training for automatic shut down of equipment in their work areas;
- Communications or alarm systems: Facility employees will be instructed as to the location and use of all telephones, intercoms, sirens, alarms, and two-way radios;
- Responses to fires or explosions: Personnel will receive fire prevention training and fire response;
- Response to spills: Personnel will receive instruction in spill and release prevention and response ; and
- Shutdowns of operations: Personnel will receive instruction in shutdown procedures during BRC CAMU operation. Personnel with operational

responsibilities are instructed in procedures for planned and unplanned shutdowns during on-the-job training.

Training sessions will be held quarterly to review new health and safety hazards and provide new employees with training. The employees will be familiar with contingency plans to deal with accidents, injuries, fires, explosions, or natural disasters as outlined in Attachment G, Accident Prevention, Contingency, and Emergency Response Plan.

2.3 Post-Closure Personnel Training

Post-closure care personnel will have received adequate training in their specific job duties. This includes OSHA 24-hour health-and-safety training as well as pertinent training in BRC CAMU maintenance procedures. In addition, staff will be trained on emergency procedures and contacts as well as hazards they may encounter at the BRC CAMU. This post-closure staff will consist of a facility manager and various staff workers as needed. The name, address, and telephone number of the facility manager will be provided to the NDEP during the closure process.

3.0 RECORDKEEPING

The BRC will maintain the following documents and records for each hazardous waste management related position at the facility:

- The job title for each position
- The name of the employee filling each position
- A written job description including requisite skill, education, or other qualifications
- Duties of employees assigned
- Description of training
- Records documenting completion of training

BRC will maintain records at their onsite facilities. All records will be kept in accordance with the record retention requirements of the AOC3.

Appendix A
Training Course Descriptions

HAZWOPER 40 Hour Course

OSHACAMPUS.com™
powered by 360training

Course Description

This course covers broad issues pertaining to the hazard recognition at work sites. OSHA has developed the HAZWOPER program to protect the workers working at hazardous sites and devised extensive regulations to ensure their safety and health. This course, while identifying different types of hazards, also suggests possible precautions and protective measures to reduce or eliminate hazards at the work place. It is specifically designed for workers who are involved in clean-up operations, voluntary clean-up operations, emergency response operations, and storage, disposal, or treatment of hazardous substances or uncontrolled hazardous waste sites. Topics include: protection against hazardous chemicals, elimination of hazardous chemicals, safety of workers and the environment, and OSHA regulations. This course covers topics included in 29 CFR 1910.120.

Regulatory

This course meets the in class training requirements of the 1910.120 standard. An additional 8 hours of hands on training is required to meet the training requirements of the standard.

Seat Time

This course has been approved for 40 hours.

Course Pre-Requisite

There are no pre-requisite requirements for this course. Upon successful completion of this course, you will be able to print your certificate.

Testing:

Quizzes: Lesson quizzes require no mastery. Quizzes at the end of each module require a passing grade to proceed to the next module. Final Exam: Final Exam must be passed with a 70% to pass the course. The final exam can be taken three times if necessary.

Topics Covered

- Regulation Overview
- Site Characterization
- Toxicology
- Hazard Recognition
- Hazard & Safety Analysis
- Hazardous Chemical Awareness
- Radiological Hazards
- Respiratory Protection
- Personal Protective Equipment
- Site Control
- Decontamination
- Medical Surveillance
- Air Monitoring
- Confined Space Entry
- Emergency Procedures
- Material Sampling

HAZWOPER 8 Hour Annual Refresher Course

OSHACAMPUS.com™
powered by 360training

Course Description

This course meets the requirements in OSHA 29 CFR 1910.120 for 8 hours of annual refresher training for workers at hazardous waste sites. This course is designed for general site workers who remove hazardous waste or who are exposed or potentially exposed to hazardous substances or health hazards. Topics include HAZWOPER regulations, safety and health plans, hazardous chemicals, safety hazards, air monitoring, medical surveillance, site control, decontamination, personal protective equipment, and respiratory equipment. This course covers the topics in OSHA 29 CFR 1910.120

Learning Objectives

- Read and understand OSHA regulations and requirements
- Use Site Characterization to identify hazards found in the workplace and steps to be taken to minimize hazards
- Understand the principles of toxicology and how they relate to various types of chemical exposures
- Develop a Medical Surveillance Program and understand its purpose
- Identify the uses for Personal Protective Equipment (PPE) and how to choose the correct PPE for a situation
- Understand the principles of decontamination as well as levels of decontamination and decontamination methods
- Have a better understanding of potentially hazardous situations involving corrosives, solvents, oxidizers, and reactive chemicals
- Understand the various considerations in an emergency and the importance of training and actions to personal safety and the safety of others

Topics Covered

- Regulation Overview
- Hazard Recognition
- Site Characterization, Analysis, and Control
- Toxicology
- Medical Surveillance
- Safe Work Practices and PPE
- Decontamination
- Chemical Awareness
- Emergency Procedures

Regulatory

Please refer to the state/regulatory requirement in the course catalog page.

Seat Time

This course has been approved for 8 hours

Course Pre-Requisite

Must have taken the 24 or 40 hour HAZWOPER course

Testing

Quizzes: All quizzes must be passed with a 100% to proceed to the next lesson. Final Exam: Final exam must be passed with a 70% to pass the next course. The final exam can be taken three times if necessary.

Standard First Aid with CPR/AED - Adult
American Red Cross First Aid with CPR/AED - Adult, trains participants to recognized ad care for life-threatening respiratory or cardiac emergencies in adults and provides the knowledge and skills needed to care for injury or sudden illness until professional medical help arrives. Training complements adult learning styles with hands-on practice and real-life scenarios while take-away materials serve as excellent refresher tools after training is complete. This comprehensive course meets training guidelines for first aid programs established by the Occupational Safety and Health Administration.
Topics covered include:
Recognizing and respond to an emergency.
How to care for a person who is choking.
Checking an unconscious person for life-threatening and nonlife-threatening conditions.
Recognizing and caring for a person who is not breathing.
How to care for a heart attack and how to give CPR.
Using and AED and identifying precautions when using and AED.
Identifying the signs and symptoms of sudden illness, including stroke, diabetic emergency, poisoning and allergic reactions and care for them.
Controlling bleeding.
Recognizing and caring for heat- and cold-related emergencies.

Fusion Machine Training Programs

Experience shows that improper installation, rather than faulty products, is the primary reason for system failures, delays, and cost overruns. Georg Fischer believes that the installation of our products is as important as the quality of the products we manufacture. In keeping with this belief, Georg Fischer offers several training courses.

BCF Welder Training

Course Description

Socket Fusion Training This four-hour course covers all aspects of hand-held and machine Socket Fusion Technology. Trainees will demonstrate their ability to perform socket fusion joining.	**Standard Butt Fusion Training (Conventional or CNC)** This four-hour course covers all aspects of Standard Butt Fusion Technology. Trainees will demonstrate

Upon successful completion and testing, the trainee will receive a Certificate of Completion and an Installer's Badge which may be worn on the job site.	their ability to prepare pipe, face pipe, heat and join piping.
IR Level I Welder Training This course covers fundamental training absolutely necessary for proper operation of the infrared (IR Plus) fusion machines. Topics: • Plastic pipe fundamentals • Infrared butt fusion • General information • Design/function/operation of the IR Plus fusion machines • Weld bead inspection • Basic machine maintenance Duration/Value: • 1 day/$250.00 per person Register now	**IR Level II Maintenance Training** Completion of this 16-hour (2 day) class allows the trainee to maintain external parts of the machine. Prerequisite: • All attendees must have completed the Georg Fischer IR Level I Welder Certification Program and Weld Inspection Program Topics: • Technical concepts of the machine • Machine inspections • Functional check • Maintenance procedures Level II • Alignment and adjustments • Weld evaluation • Documentation Duration/Value: • 2 days/$500.00 per person Register now
IR Level III Maintenance Training **(Authorization Required)** Completion of this 32-hour (4 day) class allows the trainee to maintain external and internal parts of the machine. This course is conducted at the Georg Fischer Tustin facility only. Prerequisite: • All attendees must have completed the Georg Fischer IR Level II Maintenance Training Topics: • Technical concepts of the machine • Machine inspections • Functional check • Maintenance procedures Level III • Alignment and adjustments • Weld Inspection Program • Documentation Duration/Value: • 4 days/$1,500.00 per person Register now	**IR Level III Refresher Training** **(Authorization Required)** This course is a refresher for Level III personnel and includes current updates for the IR 63, IR 225, and IR Plus machines. This course must be taken 1 year after the initial Level III course and then every two years after that. This course is condcuted at the Georg Fischer Tustin facility only. Prerequisite: • All attendees must have completed the Georg Fischer IR Welder Certification and IR Level II and Level III Maintenance Training. Duration/Value: • 2 days/$500.00 per person Register now
IR Weld Inspection Program (WIP) Upon completion of this eight-hour (1 day) class, the QU inspector will have a good basis to perform on-site visual IR weld evaluation. Topics: • Weld background • Terminology • Bead characteristics • Restmelt evaluation • Flow charts and checklist Duration/Value:	**BCF Welder Training** This four-hour course covers all aspects of using the BCF Flow Fusion Technology. Trainee will prepare pipe samples, insert and remove bladders, generate welds, and perform hot cleaning of the heater heads. Upon successful completion and testing, the trainee will receive a Certificate of Completion and an Installer's Badge which may be worn on the job site. Prerequisite: • All attendees must have completed the Georg Fischer IR Level I Welder Training

- 1 day/$250.00 per person

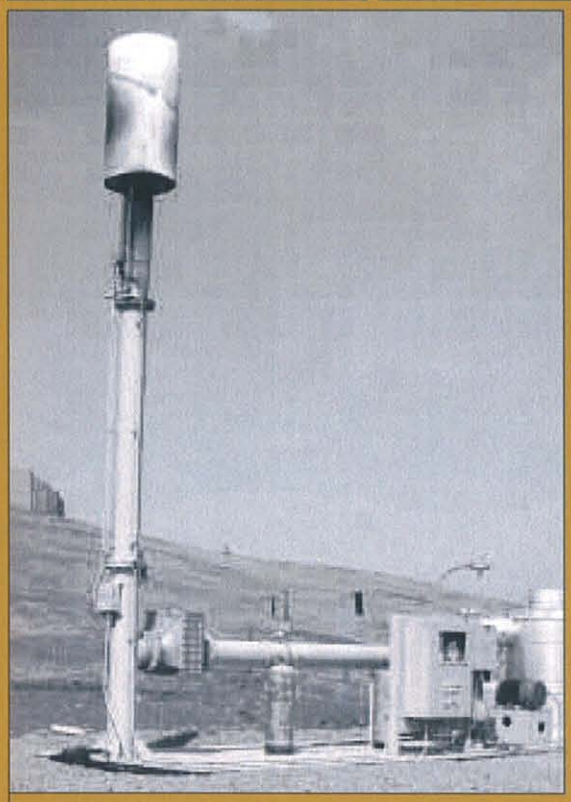
2007 TRAINING COURSE CATALOG

SWANA®

SOLID WASTE ASSOCIATION of North America

THE LEADING PROFESSIONAL ASSOCIATION IN THE SOLID WASTE FIELD



I AM**SWANA**

"Many people overlook the hard work and dedication necessary to perform a public service like solid waste management. SWANA's training courses make it possible for these men and women to operate at the highest level of performance with a sense of pride and achievement."

Bill Tobin | Director of Field Operations
Waste Authority of Montgomery County

Message from SWANA's President

INTRODUCTORY LETTER FROM TOM PARKER

Dear Colleague,

Thank you for choosing SWANA as the provider of all your training and professional development needs. For over 40 years, SWANA has thrived at the forefront of all training and education for municipal solid waste needs. This effort results from our first-and-foremost commitment to you, our members, but also to the field of solid waste.

The 2007 catalog contains training opportunities for you and all your staff. Whether you need training for professional development, for SWANA certification, or to maintain a current certification, SWANA offers specific education to fit your needs. This year SWANA Training takes place as several great locations beginning in Tampa, Fla., and closing out the year at WASTECON 2007 in Reno, Nev.

SWANA gives you what you need to stay ahead of them game with our new list of course offerings. We have updated the Manager of Landfill Operations Course (MOLO) and our ever-growing line of distance learning opportunities. With our increased offerings of E-Courses and E-Sessions, you can train individually at your desk or with your whole staff in a conference room to get the most out of your money! As with all SWANA events, in person and online, you will interact with and learn from some of the best and the brightest in the industry.

Thank you for your continued support of SWANA, and our mission to advance the practice of economically and environmentally sound management of municipal solid waste. I look forward to learning from you online or at one of our live events.

Sincerely,

Tom Parker, P.E
CDM, New Mexico
SWANA President

P.S. Receive the mark of professionalism in the solid waste industry with SWANA certification. SWANA offers eight different Certifications including the industry's only Bioreactor Landfill Certification. In this competitive landscape, it is integral to have an integrated MSW management background to efficiently manage your facility.

About the SWANA Training Catalog

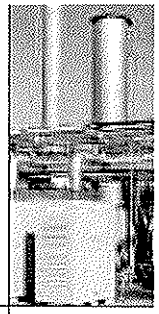
Congratulations on choosing SWANA for your professional development, training and certification!

For those of you who are new to SWANA: Welcome. To our over 7,700 loyal members, thank you for your continued support of SWANA's Technical Programs, and welcome to our new catalog format. Our new look has been designed to showcase SWANA's commitment to providing the best-in-class educational products to the entire solid waste industry. Today, SWANA continues that pledge with more educational products than ever before.

We hope the new format will make it easier for you to find just what you are looking for by using the following symbols to indicate the format of each product. Additional information including full course descriptions, is available on **www.SWANA.org** under "Educate".

- **SWANA Classroom Training:** Held at SWANA events throughout the year.
- **SWANA Chapter Partnering Events:** SWANA Chapters host additional SWANA training courses throughout North America.
- **E-Courses:** Traditional courses and brand new offerings that can be accessed from the convenience of your office. E-Courses are conducted through SWANA's web conferencing and teleconferencing system.
- **E-Sessions:** The best of SWANA's technical sessions brought to you each month through Web conferencing. These 75-minute sessions give you and your staff an opportunity to learn from the experts in this extended session. A different topic is covered every month.
- **E-Studies:** These self-paced, self-study options give you the training and the CEUs you need. All it takes is an internet browser.
- **On-Site Training:** Full training packages that you deliver to your staff at your own site and at your own pace.
- **Home Study Courses:** Written materials on important solid waste topics. Looking for CEUs – just pass the test that comes with the course and you'll qualify.
- **SWANA Training On Demand:** Do you have a group that needs to be trained and the next event isn't soon enough or your budget can't afford the cost? Let our best-in-class training come to you! Any of our courses can be customized to your needs. For quotes, contact **learn@SWANA.org**.

We love to hear about the training and educational products that you need. You can always reach us with your ideas, comments and feedback at **learn@SWANA.org**.



Getting SWANA Certified Easy As 1, 2, 3!

SWANA's Certification Training Courses

1. CHOOSE YOUR DISCIPLINE(S).

The Solid Waste Association of North America offers eight (8) certifications in the following solid waste disciplines:

- Landfill Management (MOLO)
- Bioreactor Landfill*
- Collections Systems
- Composting Programs
- Construction & Demolition Materials (C&D)
- Principles of MSW Management
- Recycling Systems
- Transfer Station Systems

* The Bioreactor Landfill certification requires candidates to hold a current SWANA Landfill management certification.

2. CHOOSE YOUR CERTIFICATION LEVEL.

Most SWANA Certifications offer at least two (2) eligibility levels, with an additional Inspector level offered to Landfill and Construction & Demolition SWANA Certification holders:

- **Technical Associate:** This level is ideal for professionals new to the industry and involved in the planning, design, implementation, operation or promotion of the MSW field. This would also include consultants, planners, vendors and regulators, etc. A minimum of a High School Degree or GED Required.
- **Manager:** This professional must meet all of the requirements of the Technical Associate level plus a minimum of five (5) years** experience in Municipal Solid Waste Management. Also required are at least two (2) years experience in a management/supervisory position*** in the discipline for which you are applying.

** 4-year degree in a related field may be substituted for up to 2 years of MSW experience
*** directly responsible for daily operations; compliance with design and permit conditions, utilization of field equipment and services, personnel needs, utilization and retention.

- **Inspector:** Unique to Landfill and Construction & Demolition certification holders, this professional must meet all of the requirements of the Technical Associate level as well as the ability to issue official citations for violations which require action/impose penalties. This professional must also be an active inspector with at least 2 years experience.

3. PASS THE SWANA CERTIFICATION EXAM FOR YOUR DISCIPLINE.

SWANA certification exams are offered at all SWANA and SWANA Chapter training events, even if the preparatory class is not being offered. You may only sit for one exam per testing session. You are not required to attend the preparatory training courses to become certified; however, it does reinforce your knowledge in a particular discipline. A passing score of 70% or above is needed to become SWANA certified. You will be allotted three (3) hours to complete your exam. All exams are proctored.

You may use calculators, preferably one capable of handling up to seven digits. Landfill Certification candidates may use MOLO scales for maps. The exam is a "closed book" exam so you may not bring manuals, worksheet or notes to the testing site. Before leaving the testing site, you will be asked to complete the SWANA Certification Application. Exam results will be mailed to the certification candidates within 60 days of the test date.

If you have any questions about becoming SWANA Certified, please contact us at **cert@SWANA.org**.

SWANA[DL] (Distance Learning)

SWANA CEUs are available for most SWANA Courses

Can't get away from work? Enjoy the industry's top training from the comfort of your home or office with SWANA[DL] (Distance Learning). With these courses, get the training you need in a format you want. SWANA[DL] allows you to train from your home or office, with your computer, or with home study manuals. Also by attending these courses, Certified Professionals can earn SWANA Continuing Education Units (CEUs). With SWANA[DL], training has never been easier!

E-COURSES

Learn, Earn and Return with these new online courses! You'll learn about a wide range of solid waste topics. Every course is taught by SWANA faculty. All you need is an internet connection and separate phone line and you're ready to learn. Each session lasts up to two hours, making SWANA training more convenient than ever! For a schedule of upcoming E-Courses, visit **www.SWANAstore.com** and click on E-Courses.

E-SESSIONS

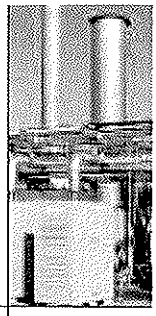
With these 75-minute presentations you can attend SWANA technical sessions all year long, from any location! These sessions bring you the latest on today's hot topics on the first three Wednesdays of the month. Each month focuses on a different area of MSW to keep you informed on all the current trends in solid waste. For a schedule of upcoming E-Session topics visit **www.SWANAstore.com** and click on E-Sessions.

E-STUDIES

Train your way with these self-paced online courses. These courses are completely online and are always a click away. The course also moves with you, so you spend your time on the areas that you need. Many of our courses also allow more than one user to train per account, with our new subscription-based pricing plan. Training has never been more flexible than it is with these courses!

Courses include:

- Landfill Operations
- Composting Operations
- Transfer Station Health and Safety
- Waste Screening
- Landfill Health and Safety
- Landfill Gas Primer
- Establishing An Electronics Recycling Program
- Integrated Solid Waste Management



SWANA[DL] (Distance Learning)

HOME STUDY COURSES ✉

Not quite ready for the world of online learning but still need convenient training? Well then look no further than SWANA Home Study Courses. Each course includes a manual that you review at your own pace. Once you're comfortable with the information, complete the enclosed exam. Score a 90% or better and you'll receive credit for the course. The manual also serves as a good reference once you've completed the course.

Courses include:

- Managing Landfill Gas at MSW Landfills
- Waste Screening at MSW Management Facilities
- Groundwater Monitoring, Sampling, Analysis & Construction
- Leachate Generation, Collection & Treatment at MSW Landfills
- Construction Waste and Demolition Debris Materials Manual

ON-SITE COURSES

Act as a trainer for your staff with these courses. Each course contains 8-10 hours of training, made up of smaller modules. This allows the courses to be tailor-made for your company.

Courses include:

- Training for Sanitary Landfill Operations Personnel
- Training for Collection Operations Personnel
- Waste Screening at MSW Management Facilities
- Health and Safety for MSW Landfill Training
- Health and Safety for MRF Personnel
- Health and Safety for Collection Personnel
- Health and Safety for Transfer Station Personnel

TRAIN YOUR WHOLE STAFF WITH SWANA E-TRAINING AND SAVE BIG!

When signing up for an E-Course or E-Sessions you register for one computer. By hooking up a projector and speaker phone, you could present E-Training to your whole staff for the cost of one registration, saving you big on training!

SWANA CEUs will only be allocated for registered individuals.

SWANA E-Training Calendar of Events

SWANA's E-Training allows you to receive the industry's best training from the comfort of your home or office. The Web seminars are the perfect way for busy professionals to stay current on the latest trends in the industry. These courses are always being updated in a continuing effort to bring you fresh, new training. The listing below is just a taste of what's to come. Keep an eye on **www.SWANAstore.com** for all the latest developments in SWANA's E-Training.

Have you attended a local training or technical session that you think all solid waste professionals could benefit from? Let us know! SWANA is always looking for ways to promote training that today's solid waste professionals can use. E-mail **learn@SWANA.org** with any topics or suggestions, as well as at which event the training was presented.

UPCOMING E-COURSES

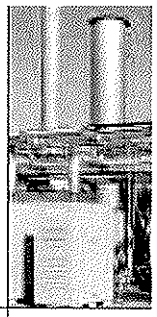
September 2007: Legislative and Regulatory Developments Impacting Solid Waste Management



SWANA Technical Divisions

SWANA's Premier Training Courses

Join one of SWANA's Technical Divisions and shape the future of solid waste management.

The Benefits include

- Access to cutting-edge information
  - TECHnews—electronic newsletter with the latest news in your specific field
  - SWANA's online eLibrary and Members Only section including the Division subscriber list
- Unmatched networking opportunities
  - Participate in an exchange of ideas with more than 2,700 Division Members
  - Receive a contact list of all Technical Division Subscribers
  - Make valuable contacts at conferences
  - Post and respond to questions through an electronic Technical Division Members list serve
- Shape the future of SWANA
  - Help develop programs for symposia
  - Guide technical policies and advocacy initiatives
  - Produce real change on industry issues
- Special discounts
  - $25 registration discount to your Division's annual symposium
  - Special discounts on publications, conference proceedings and training, and online educational sessions and events

MANAGER OF LANDFILL OPERATIONS (MOLO)

3-Day Certification Prep Course

Updated for 2007

Updated for 2007 for the Landfill Certification contains all the latest landfill techniques and technologies to keep you ahead of the competition. Learn to efficiently run your landfill, as well as gain knowledge on planning, operating and closing a landfill. Discuss issues surrounding regulatory standards, compliance with design requirements, and an introduction to state-of-the-art bioreactor landfill technologies. Upon completion of the course you will gain a better understanding of landfill economics, leachate and landfill gas management, and comprehend the importance of safety and contingency counter measures.

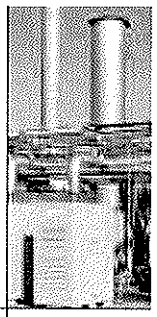
Need some help preparing for the MOLO, try these:

MOLO: JUST THE MATH E-COURSE

Planning to take the MOLO exam, but need to brush up on the math? With this live web course you can prepare for the math that is covered on the MOLO exam from your home or office. All you need is an internet connection and separate phone line and you're ready to learn the math. Taught by MOLO faculty, this course covers such calculations as elevation, area, slope, and volume. And because the course is only two hours long, you can learn and return to work. **MOLO: Just the Math does not allocate CEUs toward SWANA recertification.**

LANDFILL OPERATIONS

Need a boost to get ready for the MOLO or just need a refresher before taking the SWANA Landfill Certification Exam? Then get online with this new E-Study Course. Learn about such topics as Waste Decomposition, Geology and Hydrology, Landfill Design and Construction, General Operations, and Regulations from your computer. The course has also been enhanced with up-to-date photographs, audio, interactive exercises, related online links, and video to make learning more enjoyable.



Landfill and Landfill Gas Courses

SWANA's Premier Training Courses

THE WORLD'S ONLY BIOREACTOR LANDFILL CERTIFICATION PROGRAM

Technology is changing and bioreactor landfills are emerging. Now it is your turn to learn what bioreactors can do for you. Get career-enhancing certification by taking this prep course for the Bioreactor Landfill Certification exam. Examine the unique characteristics of a bioreactor landfill in comparison with dry tomb landfills in this brand new course. Explore the methods of introducing air and water into landfill cells, while at the same time discovering how this cutting-edge technology can increase landfill gas activity.

Special Publication: *Manager of Bioreactor Landfill Operations Body Of Knowledge*

The SWANA Manager of Bioreactor Landfill Operations Body Of Knowledge (BOK) is a compendium of the basic knowledge an individual must know to accomplish the work of a Manager of Bioreactor Landfill Operations. This BOK includes both proven traditional practices and the innovative, advanced practices of managing a bioreactor landfill, as well as empirical, esthetical, ethical and tacit knowledge. The Manager of Bioreactor Landfill Operations BOK is the basis of the SWANA Bioreactor Landfill course and certification exam.

The BOK consists of eight comprehensive knowledge statements covering the knowledge and abilities a manager of bioreactor landfills should have in the areas of construction, operation and monitoring of bioreactor landfills. You can use the BOK to prepare for the SWANA certification exam or as a tool for your operations.

Go to **www.SWANAstore.com** to order.

Landfill and Landfill Gas Courses

For SWANA CEU information, see pages 27-28.

LANDFILL OPERATIONAL ISSUES

2-Day Course/ 1-Day Workshop

This course is perfect for anyone interested in learning more about improving the daily operations at their landfill site. You will experience in-depth discussions that will help you solve everyday issues surrounding landfill operations and be able to understand successful landfill management practices, including equipment selection. Turn your landfill into a money maker by learning how to control cost, maximize your site's airspace, and determine if your landfill is really efficient. Upon completion of the course, you can earn valuable SWANA Continuing Education Units (CEUs). Furthermore, with your registration you will receive the book *The Handbook of Landfill Operations,* by Neal Bolton, P.E.

HEALTH AND SAFETY FOR MSW LANDFILL OPERATIONS PERSONNEL

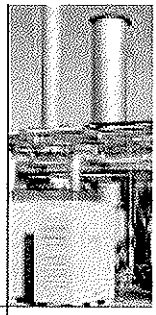
1-Day Course

Discover new horizons by enhancing your landfill health and safety program! This course prepares you to easily and intelligently identify and circumvent landfill health and safety issues. Not only will you learn exactly what elements constitute a proper loss control program, but you will understand the importance of establishing an effective program and overview OSHA and federal regulations. At the end of this course, participants will be able to recognize an unsafe practice and know how to handle it. Not only will you earn valuable SWANA Continuing Education Units (CEUs), but you will also gain imperative knowledge on how to keep your landfill safe.

LANDFILL GAS BASICS

1-Day Course

Don't waste landfill gas! Learn to "Control, Manage and Capture" it! These are the key concepts to successfully understanding landfill gas basics. Through exercises and case studies, SWANA instructors will help you grasp these three ideas in this introductory course. You will gain vital insight about gas regulations and become familiar with system design, construction and monitoring. In addition, you will be provided with information and guidance in order to understand the importance of landfill gas utilization. Anyone working with a landfill gas system will benefit from this course.



Landfill and Landfill Gas Courses

LANDFILL GAS SYSTEM OPERATION

2-Day Course and 1-Day Workshop

Go "beyond basics" with this interactive workshop exploring the daily challenges associated with operations and maintenance of LFG systems. Share knowledge with your colleagues and learn new approaches for capturing, controlling, and managing landfill gas. This interactive session will be moderated by a SWANA faculty member, and is a great way to actively increase your knowledge of landfill gas systems.

TRAINING FOR SANITARY LANDFILL OPERATIONS PERSONNEL

1-Day Course

Through interactive classroom exercises, discussions and case studies, you will overview landfill operations and how they relate to one another in order to learn how to be more effective on the job. Instructors with in-depth experience in landfill operations will help you gain a better understanding of the fundamentals of groundwater movement, accident analysis and recognize the factors that contribute to leachate production. In addition, receive top of the line training on how sanitary landfills work as components of integrated solid waste management systems.

LANDFILL GAS PRIMER

Gain vital insight about gas regulations and become familiar with system design, construction and monitoring. In addition, you will be provided with information and guidance in order to understand the importance of landfill gas utilization. Anyone working with a landfill gas system will benefit from this course. As with all online E-Study Courses, you determine the pace and schedule of the course.

ECTC PRESENTS CONTROLLING EROSION & STORM WATER RUNOFF ON LANDFILL CAPS

Finish your landfill off with style with this new E-Course. In a partnership with the Erosion Control Technology Council (ECTC), SWANA is proud to present this new E-Course to help landfill owners create more presentable landfill caps through the use of Rolled Erosion Control Products (RECPs). Presented by a member of ECTC, this course will cover such topics as NPDES Regulations, an overview of RECPs, as well as the installation, design, and selection of RECPs.

Landfill and Landfill Gas Courses

For SWANA CEU information, see pages 27-28.

CONSTRUCTION WASTE & DEMOLITION DEBRIS RECYCLING... A PRIMER

An educational tool for communities and private sector interests, this document focuses on the planning issues and implementation opportunities associated with the recycling of construction waste and demolition debris. Lessons covered include regulatory climate, generation data, materials, market opportunities, and management systems to name a few. Keep the manual for future reference, so you'll always have this valuable information at your fingertips.

MANAGING LANDFILL GAS AT MUNICIPAL SOLID WASTE LANDFILLS

This course is perfect for those seeking guidance on the complex issue of landfill gas management. This course covers such topics as MSW landfill emission generation, composition, migrations and extraction components, as well as regulatory codes pertaining to RCRA and the Clean Air Act. As with all Home Study Courses, keep the manual for future reference!

LITTER MANAGEMENT AT MSW LANDFILLS

Are you blown away by the cost of litter at your landfill? Let SWANA help you clean up your act with Litter Management at MSW Landfills. Learn about the impact of litter and the importance of a good litter management program, as well as the sources and causes of litter. Learn about litter control techniques from one of the industry's top professionals from the comfort of your home or office.

LEACHATE GENERATION, COLLECTION AND TREATMENT AT MSW LANDFILLS

Learn about the common constituents that make up groundwater and biological treatment. Also get an understanding of the regulatory scope of RCRA Subtitle D in regards to groundwater monitoring, and become familiar with leachate recirculation methods. Keep the manual for future reference, so you'll always have this valuable information at your fingertips.

GROUNDWATER MONITORING, SAMPLING, ANALYSIS AND WELL CONSTRUCTION

This course provides MSW professionals with an understanding of monitoring groundwater within the scope of RCRA Subtitle D. Topics include design and construction of wells, monitoring programs, and corrective actions. As with all Home Study Courses, keep the manual for future reference!

Collection and Transfer Courses

For SWANA CEU information, see pages 27-28.

MANAGING TRANSFER STATION SYSTEMS

3-Day Certification Prep Course

Be a lean mean, transfer operations machine! As a prep course for the Transfer Systems Certification exam, anyone who is or would like to become a transfer station manager or consulting engineer will be provided with fundamental information on ways to effectively plan, design, and operate MSW transfer stations. Receive cutting edge training on how to run a MSW transfer station in the most successful way by experiencing a hands-on tour, a field exercise at a local transfer station facility and classroom taught exercises. In addition, learn about design objectives including capacity, selection of appropriate technology, structure considerations and site planning.

MANAGING MUNICIPAL SOLID WASTE COLLECTION SYSTEMS

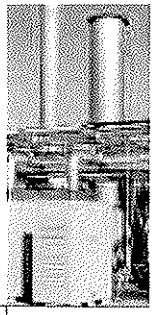
3-Day Certification Prep Course

Be able to handle waste with haste through this prep course for the Collection Systems Certification exam. Receive instruction in all the areas tested on the exam, such as an understanding of the logistics of planning, managing and operating solid waste and recyclables collection services. This course consists of presentations, classroom exercises and case studies that will enable you to navigate and chart routes more effectively. You will examine waste characteristics, service types, equipment, routing and system design. Furthermore, learn up-to-date practices for handling various materials, including residential MSW, traditional recyclables, yard wastes, bulky items and commercial wastes.

TRAINING FOR COLLECTION OPERATIONS PERSONNEL

1-Day Course

Save time and money on every route, every day! Individuals who are responsible for the collection of solid waste and recyclables from household and commercial establishments on a day-to-day basis can increase their knowledge of collection strategies. Be provided with what every collection operations personnel should know through interactive classroom exercises, discussions and case studies. Time is money, and this course will help you to acquire a higher understanding of routing in order to be cost-efficient. Furthermore, learn how to define a preventative maintenance program, go over the importance of effective sanitation practices, and obtain insight on important health and safety issues.



Collection and Transfer Courses

SWANA'S ON-LINE TRAINING COURSES

Why "waste" an opportunity to improve your safety performance? At SWANA, we recognize the importance of minimizing risk and developing an effective safety program for transfer station personnel. During this course, you will get an overview of OSHA and federal regulations. Also, you will discuss musculo-skeletal disorders and how to prevent ergonomic injuries. Upon completion, you will understand why it is essential to establish a transfer station health and safety program as well as learn to recognize unsafe practices of others. Earn valuable SWANA CEUs for a range of Certification Disciplines by participating in this extremely important course!

HEALTH AND SAFETY FOR TRANSFER STATION PERSONNEL

1-Day Course

Does it pain you to see the unsafe work habits of your collection personnel? Well let SWANA help you reduce those pains with our Health and Safety for Collections Personnel Course. This kit comes with everything a supervisor or manager needs to train their employees on proper techniques and precautions to reduce workplace injuries. Other topics covered in this course include loss control, and health and safety issues, as well as regulatory issues.

Appendix B
Site Specific Training
Lesson Plan and Exam

Pre-Entry Briefing

Objective: The objective of this pre-entry briefing is to introduce visitors and first-day employees to the safety controls of the BRC CAMU. Attendees should understand where active portions of the site are, where emergency response equipment is located, site hazards (chemical, physical, biological), and general safety rules of the BRC CAMU.

Active Areas
Indicate on map:

- haul routes
- waste excavation (exclusion, contamination reduction, support zones, as appropriate)
- waste placement (exclusion, contamination reduction, support zones, as appropriate)

Emergency Response:

Contact Name

Phone number(s)

Hospital Location

Location of emergency equipment (fire extinguishers, alarms)

Meeting location(s)

First Aid steps: Check-Call-Care

Personal Protection Equipment

Hardhat – at all times

Steel Toe Boots – at all times

Eye protection – at all times

Hearing Protection – where applicable

Tyvek – where applicable

Gloves – where applicable

Respirator – where applicable

Basic Site Safety:

1. Keep your mind on your work at all times. No horseplay on the job. Injury or termination or both can be the result.

2. Personal safety equipment must be worn as prescribed for each job, such as: safety glasses for eye protection, hard hats at all times, gloves when handling materials, and safety shoes..

3. Watch where you are walking. Don't run.

4. Seat belts are required at all times when driving/operating.

5. The use of illegal drugs or alcohol or being under the influence of the same on the project shall be cause for your immediate termination. Inform your supervisor if taking strong prescription drugs that warn against driving or using machinery.

6. Do not distract the attention of fellow workers. Do no engage in any act that would endanger another employee.

7. Sanitation facilities are provided for your use. Defacing or damaging these facilities is forbidden.

8. Never move an injured person unless it is absolutely necessary. Further injury may result. Keep the injured as comfortable as possible and utilize job site first-aid equipment until an ambulance arrives.

9. Know where firefighting equipment is located and be trained on how to use it.

10. Nobody but operator shall be allowed to ride on equipment unless proper seating is provided.

11. Do not use power tools and equipment until you have been properly instructed in the safe work methods and become authorized to use them.

12. Do not enter an area that is barricaded or otherwise blocked from entry.

13. If you must work around trucks or heavy equipment, make sure operators can always see you and know that you are there. Barricades are required for cranes.

14. Never oil, lubricate, or fuel equipment while it is running or in motion. Do not perform these operations on equipment in areas not specifically designated for these operations.

15. Before servicing, repairing, or adjusting any powered tool or piece of equipment, disconnect it, lock out the source of power, and tag it out.

16. Barricade danger areas. Guard rails or perimeter cables may be required.

17. Trenches over five feet deep must be shored or sloped as required. Keep out of trenches or cuts that have not been properly shored or sloped. Excavated or other material shall not be stored nearer than two feet from the edge of the excavation. Excavations less than 5 ft may also require cave in protection.

18. Use the "four and one" rule when using a ladder. One foot of base for every four feet of height.

19. Know what emergency procedures have been established for your job site. (location of first aid kit, fire extinguisher locations, evacuation plan, etc.)

Hazard Analysis

Physical
Heat Stress
Excavation
Hand/Foot Injury
Heavy Equipment
Noise
Portable Power/Hand Tool
Slip/Trip/Fall

Chemical
Inhalation
Skin absorption
Fire
Reactivity

Biological
Insect/Vermin/Snake Bites

Exam

The pre-entry briefing exam will be taken at the conclusion of the meeting. A passing rate of 75% is required for access to the site. Incorrect answers will be explained and topics covered again.

Pre-entry Briefing Exam

Name:_____
I have read and understand the BRC CAMU Health and Safety Plan Yes No
Date:_____

Position:_____

1. What are the three emergency first aid steps?

   A. Stop-Look-Listen
   B. Call-Check-Care
   C. Check-Call-Care
   D. None of the Above

2. You are working near an excavator, what PPE do you need?

   A. Hardhat, boots, eye protection, hearing protection
   B. Boots, hardhat
   C. Hardhat, hearing protection
   D. None of the above

3. When excavating, at what depth is shoring required?

   A. 3 feet
   B. 1 foot
   C. 5 feet
   D. 2 feet

4. You are not 24-hour or 40-hour HAZWOPER certified, how close can you be to the excavation or waste placement activities?

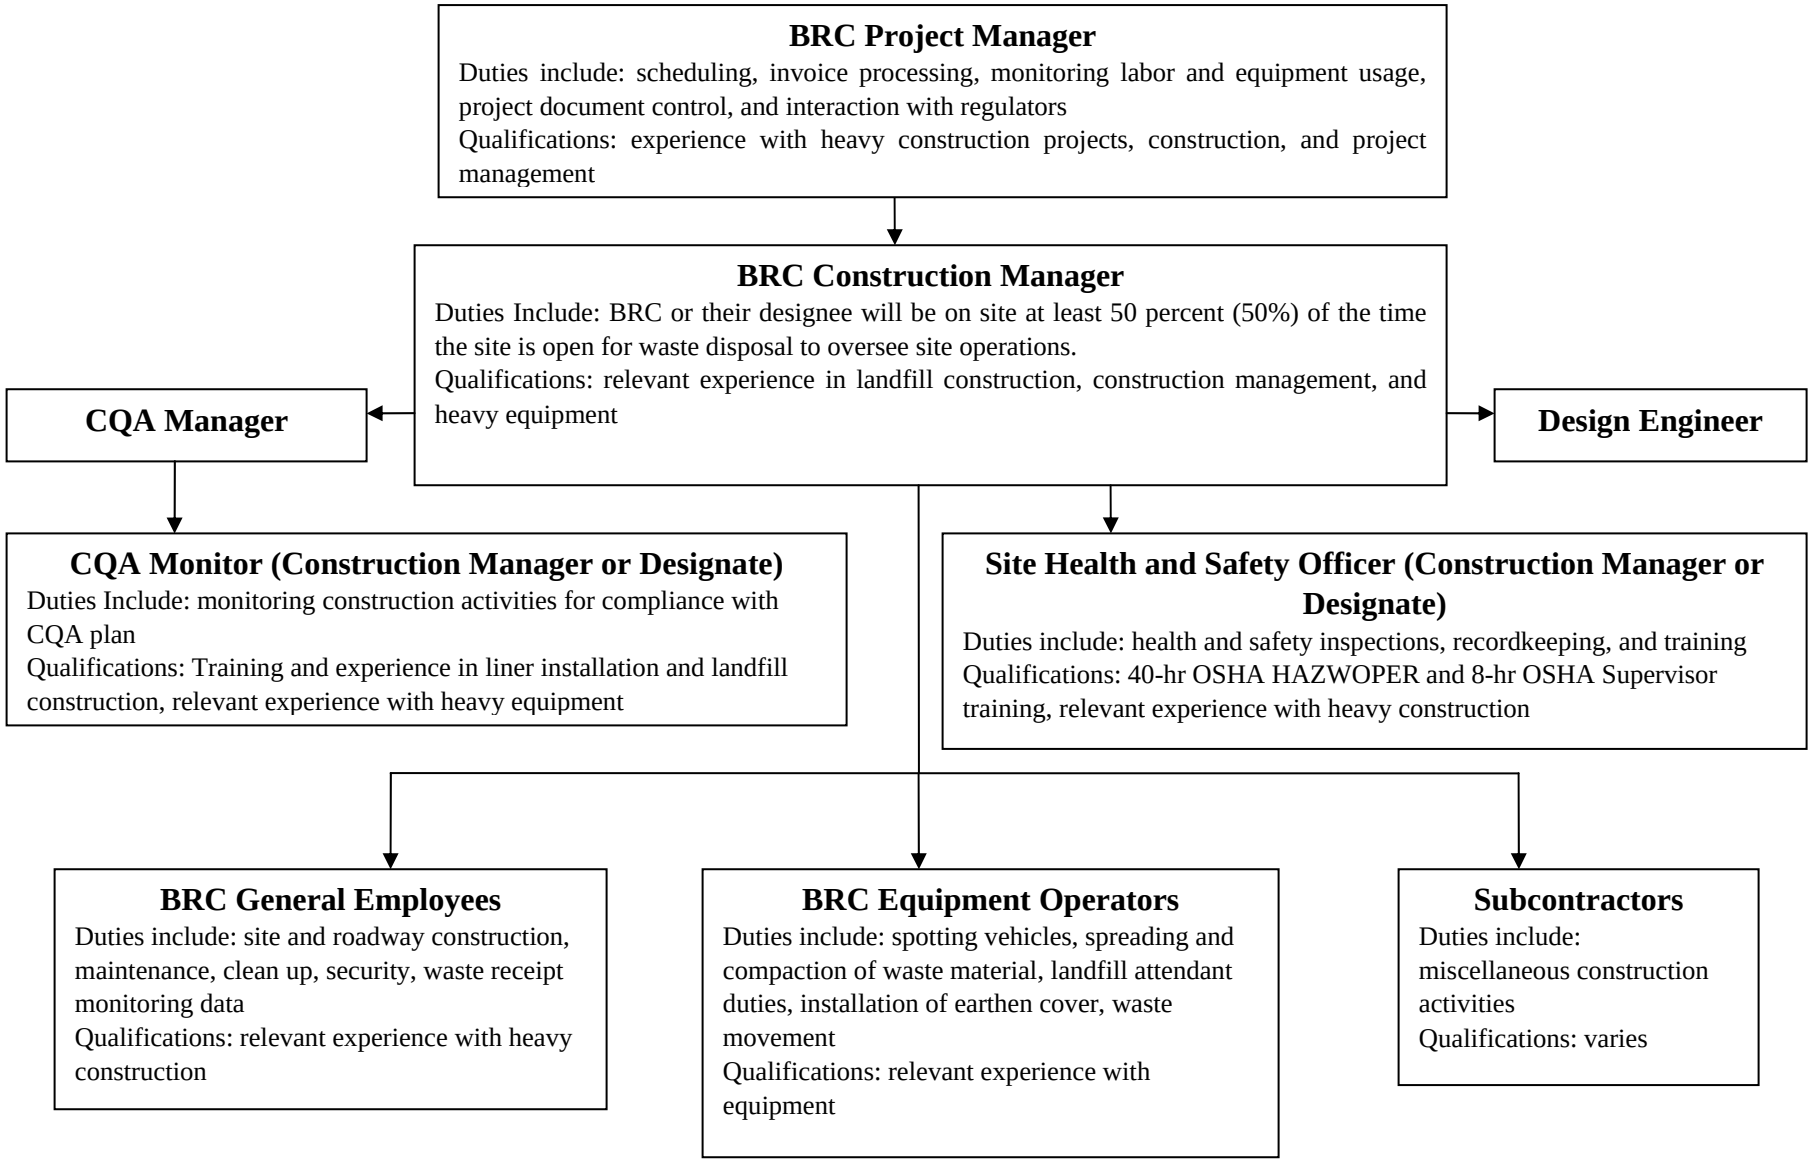
   A. Exclusion Zone
   B. Contamination Reduction Zone
   C. Support Zone
   D. None of the Above

5. What's the first step in an emergency?

   A. Call BRC
   B. Go to a safe location
   C. Go Home
   D. None of the above

Number Incorrect:_____ Pass / Fail Trainer's Name:_____

Appendix C
Organizational Flowchart



BRC Project Manager
Duties include: scheduling, invoice processing, monitoring labor and equipment usage, project document control, and interaction with regulators
Qualifications: experience with heavy construction projects, construction, and project management
BRC Construction Manager
Duties Include: BRC or their designee will be on site at least 50 percent (50%) of the time the site is open for waste disposal to oversee site operations.
Qualifications: relevant experience in landfill construction, construction management, and heavy equipment
CQA Manager
Design Engineer
CQA Monitor (Construction Manager or Designate)
Duties Include: monitoring construction activities for compliance with CQA plan
Qualifications: Training and experience in liner installation and landfill construction, relevant experience with heavy equipment
Site Health and Safety Officer (Construction Manager or Designate)
Duties include: health and safety inspections, recordkeeping, and training
Qualifications: 40-hr OSHA HAZWOPER and 8-hr OSHA Supervisor training, relevant experience with heavy construction
BRC General Employees
Duties include: site and roadway construction, maintenance, clean up, security, waste receipt monitoring data
Qualifications: relevant experience with heavy construction
BRC Equipment Operators
Duties include: spotting vehicles, spreading and compaction of waste material, landfill attendant duties, installation of earthen cover, waste movement
Qualifications: relevant experience with equipment
Subcontractors
Duties include: miscellaneous construction activities
Qualifications: varies

1.0 INTRODUCTION

This Accident Prevention, Contingency, and Emergency Response Plan describes the precautions taken to prevent accidental ignition or reaction of ignitable or reactive wastes, and precautions taken to prevent interaction of incompatible wastes. This plan also includes other procedures to minimize the possibility of, and hazards from, a fire, explosion, or unplanned sudden or non-sudden release of hazardous waste constituent to air, soil, or surface water. These procedures also address the proper design, construction, maintenance, and operating practices designed to reduce the potential for injury or other threats to human health or the environment.

1.1 Contaminants

Extensive testing of the waste material determined the majority of wastes to be non-hazardous. The following is a list of general contaminants found in the waste material to be placed in the CAMU:

- VOCs
- SVOCs
- PCBs
- Metals
- Pesticides

The waste materials are not incompatible, reactive, or ignitable. Additional waste characterization detail can be found in Attachment C, Waste Analysis Plan.

2.0 PREVENTION

2.1 Health and Safety Plan

The BRC CAMU will have an active Health and Safety program for workers at the BRC CAMU. Either the current BRC Health and Safety Plan (HASP) or a similar plan developed by the pertinent contractor will be used, periodically updated, and kept on site. A safety meeting will be held at least quarterly to review safety procedures and issues, or whenever operations change. Daily safety tailgate meetings will address health and safety issues of the day. Employees working at the BRC CAMU will attend. Personal safety equipment such as eye protection, steel-toed boots and hard hats will be required of all BRC CAMU non-office personnel. In case of personal injury, the field office will be notified immediately by two-way radio or cellular telephone and, if necessary, an ambulance summoned from the local hospital, St. Rose de Lima

approximately 1 ¼ miles from the BRC CAMU (Figure G-1), or the local (City of Henderson or Clark County) Fire Department.

2.2 Arrangements with Local Authorities

Prior to operation, BRC will contact the Henderson Police and Fire Departments and the Clark County Sheriff and Fire Departments and their emergency response teams to make arrangements to familiarize them with the BRC CAMU. BRC will provide details of the BRC CAMU including layout, properties of wastes handled and associated hazards, normal operating areas, entrances, and possible evacuation routes. In addition, BRC will contact the St. Rose de Lima Hospital with the types of injuries or illnesses that could potentially occur at the BRC CAMU.

2.3 Personal Protective Equipment (PPE)

Level D PPE will be required at all times at the Site. Level D equipment required includes long pants, gloves, steel-toe boots, hard hats, safety glasses, and hearing protection (when appropriate).

2.4 Exposure Assessment and Air Monitoring

Given the small amount of additional to be placed in the Phase V of the CAMU, dust monitoring, similar to what was conducted during the bulk of the CAMU waste placement, is not cost-effective and will not be implemented. Based on prior air monitoring results, use of dust control measures should not create any off-site dust migration above relevant regulatory thresholds.

2.5 Activity Hazard Analysis

The chemical, physical, and biological hazards are discussed in detail in the Site HASP for each activity performed on-site.

2.6 Personnel Training

Employees assisting in construction activities within the exclusion zone will have Occupational Safety and Health Administration (OSHA) 40-hr Hazardous Waste Operations and Emergency Response Standards (HAZWOPER) certification. In addition, BRC and/or their designee will have 8-hr OSHA Site Supervisor training. The

CAMU Construction Manager will be required to provide health and safety "tail gate" meetings for new workers and visitors. Employees are responsible for knowing the site chemical, biological, and physical hazards as well as how to prevent accidental release of wastes.

2.7 Site Map

A site map will be maintained on site. The site map will be regularly updated to show the exclusion zone, decontamination zone, and support zone as they change throughout BRC CAMU construction. The site map shall be posted in the work area and will include the following information:

- General Wind Direction
- Evacuation Routes
- Refuge Locations
- Route to St. Rose de Lima Hospital and First Aid Medical Assistance (may be provided on separate map)
- Boundaries of Exclusion Zone (as described below)
- Boundaries of Contamination Reduction Zone (as described below)
- Boundaries of Support Zone (as described below)

Changes will be made to the site map by the SHSO, as needed, based on site conditions.

2.7.1 Work Zones

Three work zones will be established for each task. The Exclusion Zone is defined as the area on-site where contamination is suspected and tasks are to be performed. The Contamination Reduction Zone (CRZ) is defined as the area where equipment and workers are to be decontaminated. The Support Zone is defined as the command area and also serves as a storage area for supplies. The exact location and extent of the work zones will be modified as necessary.

2.8 Site Access

Access to the site will be controlled using a sign-in/sign-out log.

2.9 Visitors

Visitors to the site will be continually escorted in order to assure their safety since they may be unfamiliar with the site. Visitors will not be allowed past the Support Zone unless they read, understand, sign, and meet the requirements outlined in the Site HASP.

2.10 Communications

On-site communications will be conducted through the use of the following:

- Verbal
- Two-way radio
- Horn
- Mobile telephone
- Siren
- Hand signals

Off-site communications will be conducted through the use of mobile telephones.

2.11 Safe Work Practices

General Safe Work Practices that will be implemented during work activities at this site are:

- Minimization of contact with waste materials.
- Smoking, eating, or drinking after entering the work zone and before decontamination will not be allowed. Employees who are suspected of being under the influence of illegal drugs or alcohol will be removed from the site. Workers taking prescribed medication that may cause drowsiness will not be permitted to operate heavy equipment, and will be prohibited from performing tasks where Level C, B, or A PPE is required.
- Good housekeeping will be practiced.
- Use of contact lenses on-site will not be allowed when dictated by working conditions.
- The following conditions will be observed when operating a motor vehicle.
  - Wearing of seat belts is mandatory
  - During periods of rain, fog, or other adverse weather conditions, the use of headlights is mandatory
  - A backup warning system or use of vehicle horn is mandatory when

the vehicle is engaged in a backward motion
  - All posted traffic signs and directions from flagmen will be observed
  - Equipment and/or samples transported in vehicles will be secured from movement
- In an unknown situation, the worst conditions will always be assumed.
- Conflicting situations may arise concerning safety requirements and working conditions and will be addressed and resolved rapidly by BRC to relieve any motivations or pressures to circumvent established safety policies.
- Breaches of specified safety protocol will not be allowed.

2.12 Inspections

BRC will conduct weekly health and safety inspections. The inspections will be documented using the Inspection checklist included with Attachment E. The Weekly Health & Safety Inspection Checklist will be kept on file at the project site.

2.13 Decontamination

PPE will be decontaminated as per 29 CFR §1910.120(k). The decontamination procedures, equipment and decontamination solution required for each task will be included in the Site Health and Safety Plan. In an emergency, the primary concern is to prevent the loss of life or severe injury to site personnel. If immediate medical treatment is required to save a life, decontamination will be delayed until the victim is stabilized. If decontamination can be performed without interfering with essential life-saving measures or first aid, or if worker has been contaminated with an extremely toxic or corrosive material that could cause severe injury or loss of life, decontamination will be performed in coordination with or prior to initial medical treatment at the scene.

3.0 CONTINGENCY AND EMERGENCY RESPONSE PLAN

3.1 Fire Control

Fire extinguishers will be on hand to put out small fires near the working area, in the remote possibility they may occur. In the event of a significant fire emergency, the Henderson Fire Department will be notified immediately and the emergency will be reported.

3.2 Shut Down Procedures

In the event the BRC CAMU needs to be shut down, a detailed procedure list will be available at the site in the contingency plan. Step-by-step procedures will be detailed, including maps showing pertinent locations of systems.

3.3 Hazardous or Toxic Materials Release

A Hazardous Materials Emergency Plan will be prepared. It will mainly focus on those chemicals and materials associated with vehicle fueling and maintenance. Because the waste material being disposed of in the BRC CAMU is from a known source area, the likelihood of hazardous or toxic material release resulting from the waste materials is minimal.

3.4 Emergency Procedures

The following steps will be followed when there is an emergency:

1. BRC, or alternate, will be immediately notified. BRC assumes control of the emergency response.
2. As necessary, off-site emergency responders (e.g., fire department, hospital, police department, etc.) will be notified as to the nature and location of the emergency on site. Please see Table G-1 for contact information.
3. If applicable, BRC evacuates the site. Site workers will move to their respective refuge stations using the evacuation routes provided on the Site Map.
4. BRC CAMU Construction Manager will assess possible hazards to human health or the environment resulting from the emergency and shall contact the appropriate authorities for the Henderson, Nevada area or the National Response Center (toll free: (800) 424-8802). The report will include:
    a. Name and telephone number of the reporter;
    b. Name and address of the BRC CAMU;
    c. Time and type of incident;
    d. Name and quantity of material(s) involved, to the extent known;
    e. The extent of injuries, if any; and
    f. The possible hazards to human health, or the environment, outside the facility.

5. For small fires, flames will be extinguished using the fire extinguisher. Large fires will be handled by the fire department.
6. In an unknown situation or if responding to toxic gas emergencies, appropriate PPE, including SCBAs, will be donned.
7. If chemicals are accidentally spilled or splashed into eyes or on skin, safety eyewash and/or shower will be used.
8. Before continuing site operations, after an emergency involving toxic gas, BRC will don a SCBA and utilize appropriate air monitoring equipment to verify that the site is safe.
9. An injured worker shall be decontaminated appropriately.
10. If a worker is injured, first aid will be administered by workers certified in first aid.

3.5 Reporting

BRC will note in the operating record the time, date, and details of any incident that requires implementing this plan. The report will be submitted to the NDEP and include:

a. Name, address, and telephone number of the owner or operator;
b. Name, address, and telephone number of the facility;
c. Date, time, and type of incident;
d. Name and quantity of material(s) involved;
e. The extent of injuries, if any;
f. An assessment of actual or potential hazards to human health or the environment, where applicable; and
g. The estimated quantity and disposition of recovered material that resulted from the incident.

Incident reports will be kept as part of the operational records and maintained by BRC for at least 3 years and otherwise in accordance with the records retention provision of the AOC3.

Copies of Letters Sent to Police, Fire, and Hospital Emergency Contacts

Basic Remediation
COMPANY

February 20, 2007

Mr. Val Baciarelli
President
St. Rose Dominican Hospital-Rose de Lima
102 East Lake Mead Parkway
Henderson, Nevada 89015

Dear Mr. Baciarelli,

As you may know, work will soon commence on the clean-up and restoration of the 2200 acre tract owned by our affiliate, the LandWell Company, that is bounded on the south by Lake Mead Parkway, on the west by Boulder Highway, and on the north by the Las Vegas Wash. This clean-up and restoration is being conducted under the jurisdiction and supervision of the Nevada Division of Environmental Protection, with significant input from the City of Henderson and Clark County. As part of this project, we have developed Accident Prevention, Contingency, and Emergency Response Plans. These plans provide for fire, police, and medical responses, if needed. We have designated the St. Rose Dominican Hospital as primary responder in the event of injury. While we do not expect problems to arise that would require a response by the Hospital's emergency room, we want to be prepared for such a contingency. If you would like a more detailed briefing in person on details of the clean-up and restoration project, I would be happy to provide this. I can be contacted at 702-567-0400 and at sahuron@earthlink.net.

Sincerely,

Ron Sahu, Ph.D., CEM
Project Manager

875 West Warm Springs, Henderson, Nevada 89015 • Phone 702.567.0400 • Fax 702.567.0473

Basic Remediation
COMPANY

February 20, 2007

Mr. Richard D. Perkins
Chief of Police
Henderson Police Department
223 Lead Street
Henderson, Nevada 89015

Dear Chief Perkins,

As you may know, work will soon commence on the clean-up and restoration of the 2200 acre tract owned by our affiliate, the LandWell Company, that is bounded on the south by Lake Mead Parkway, on the west by Boulder Highway, and on the north by the Las Vegas Wash. This clean-up and restoration is being conducted under the jurisdiction and supervision of the Nevada Division of Environmental Protection, with significant input from the City of Henderson and Clark County. As part of this project, we have developed Accident Prevention, Contingency, and Emergency Response Plans. These plans provide for fire, police, and medical responses, if needed. We have designated the Henderson Police Department as primary responder in the event of theft or assault. While we do not expect problems to arise that would require a response by the Police Department, we want to be prepared for such a contingency. If you would like a more detailed briefing in person on details of the clean-up and restoration project, I would be happy to provide this. I can be contacted at 702-567-0400 and at sahuron@earthlink.net.

Sincerely,

Ron Sahu, Ph.D., CEM
Project Manager

1.0 INTRODUCTION

The BRC CAMU emergency coordinator is completely familiar with the site operation and Accident Prevention, Contingency, and Emergency Response Plan. In addition, the emergency coordinator must be familiar with all activities at the facility, the location and characteristics of waste handled, the location of all records within the facility, and the layout. The emergency coordinator is responsible for directing the emergency procedures outlined in Attachment G. He or she shall have successfully completed all training and is responsible for the training records of all personnel outlined in Attachment G. The contact information for two additional individuals is also provided who can also fulfill this role. At least one individual shall be within 30 minutes of the BRC CAMU until closure.

1.0 INTRODUCTION

This attachment describes the geological, hydrogeological, and climatic conditions at the BRC CAMU. In addition, location standards and siting requirements for the proposed BRC CAMU are discussed.

2.0 GEOLOGIC CONDITIONS

This section summarizes the geological conditions present at the BRC CAMU site. The Draft Conceptual Site Model (CSM) for the Common Areas prepared by Daniel B. Stevens & Associates (DBS&A, 2006) provides greater detail about the geological and hydrogeological conditions at the site.

2.1 Geology

Regional Geology in Southern Nevada is the Basin and Range Province morphology of the Western Cordillera of North America. In this region, Cenozoic tectonic extension has resulted it a system of fault-bounded mountains separated by sediment-filled valleys. The basins consist of down-dropped blocks of crust while the ranges are upthrust slabs with a regional tilt to the east. The typical arrangement in the Basin and Range system is a valley bounded on each side by a normal fault running parallel to the range (DBS&A, 2006).

The BRC CAMU site is located in the Las Vegas Valley, a northwest-southeast trending basin within the Basin and Range Province. The predominate range influencing the BRC CAMU site conditions is the McCullough Mountains bounding the valley to the south (DBS&A, 2006).

Valley fill in the vicinity of the BRC CAMU site consists of Tertiary Muddy Creek Formation (TMCf) and overlying Quaternary Alluvium (Qa) associated with alluvial fan deposits shed from the McCullough Range Mountains. The Qa is the present-day land surface at the CAMU as well as in most of the Henderson area and has an average thickness of 50 to 60 feet. The Qa is predominantly sands and gravels classified as poorly graded gravels (GP), silty gravels (GM), well-graded sands (SW), poorly graded sands (SP), and silty sands (SM) in accordance with the Common Unified Soil Classification System (USCS) (DBS&A, 2006).

Beneath the BRC CAMU site, the boundary between the Qa and TMCf is an unconformity that represents a period of time when the TMCf strata was likely exposed to weathering and erosion. Erosion by streams originating in the McCullough Mountains cut into the TMCf resulting in paleochannels that were later filled by Qa. Two

paleochannels have been inferred in the vicinity of the CAMU site: one paleochannel from the south-central area to the northwest corner and a second paleochannel from the northeast corner of the CAMU site trending almost due north (DBS&A, 2006).

Beneath the Qa is lies the TMCf consisting of predominantly fine-grained sandy silts and clayey silts. Layers with increasing sand content are encountered. With the increasing distance east and north from the McCullough Range, the proportion of coarse-grained sediments in the upper portion of the TMCf appears to decrease. The total thickness of the TMCf is unknown with measurements varying from 2,158 feet to 3,050 (DBS&A, 2006).

2.2 Hydrogeology

Groundwater flow beneath the BRC CAMU site is generally to the north, northeast. Groundwater ranges from approximately 1725 ft Mean Sea Level (MSL) to 1695 ft MSL from the southern to northern areas of the BRC CAMU (Figure C7). The groundwater flow is approximately parallel to the slope of the land surface. The average gradient of the water table ranges from about 0.02 to 0.04 ft/ft with a hydraulic conductivity typically ranging from a few inches to up to 33 feet per day (ft/d). The Qa is unsaturated towards the east, with saturation first noted in the uppermost TMCf, near the contact between the Qa and the TMCf. The groundwater treatment system located on the eastern property adjacent to the CAMU is thought to have dewatered the Qa (DBS&A, 2006).

Groundwater quality in the Qa is poor. General water quality analysis performed on a groundwater sample collected from Kerr-McGee monitoring well M-10, which is installed upgradient of the BMI Complex, reported relatively high concentrations of total dissolved solids (2,680 mg/L), chloride (732 mg/L), and sulfate (857 mg/L) (ERM-West Inc., 1996).

Beneath the Qa, within the TMCf, groundwater exists generally under confined conditions in saturated coarser-grained lenses. Water in wells screened in the upper portion of the TMCf rose under the confining pressure to elevations within the Qa indicating an upward flux gradient from the TMCf into the overlying alluvium. The hydraulic conductivity in the TMCf was approximately 12 ft/d (DBS&A, 2006).

Recharge to the Qa due to precipitation is generally considered to be negligible but has increased in recent years due to increasing irrigation infiltration, sewage treatment plant effluent, and from the removal of phreatophytic vegetation near the washes (Geraghty & Miller, 1993). Natural discharge from the Qa is primarily due to springs, direct evaporation, and evapotranspiration, with little or no water discharging to the Las Vegas Wash (Geraghty & Miller, 1993, after USBR, 1982).

3.0 CLIMATE

The Las Vegas Valley is one of the driest and warmest areas in the nation. The climate consists of hot summers, and cool winters. Summer temperatures above 105° Fahrenheit (F) and winter temperatures below freezing are common. The average daily minimum and maximum temperatures during winter months are about 35º and 60º F. During summer nights, minimum temperatures average 70º to 75º F. The frost-free period averages about 241 days per year (Geraghty & Miller, 1993, after USBR, 1982).

The Las Vegas Valley is characterized by low annual rainfall, approximately 4.5 inches per year, that fall during two rainy seasons. During the winter, the rainfall is generally low-intensity and falls over a wide area. In the spring and fall, local thunderstorms subject the area to high-intensity rains of short duration, which can cause high-runoff conditions. Maximum rainfall within a 24-hour period for a 25-year storm is approximately 2.3 inches (NOAA Atlas 2, undated) in the site area.

Evaporation is high in the Las Vegas Valley, influenced by high temperatures, high winds, and low humidity (average 20%). Pan evaporation data form the period of 1985 through 1988 range from approximately 2.5 inches/month to more than 17 inches/month (ERM-West, Inc., 1996, after Law Engineering, 1993). The months with the highest evaporation (May through September) correspond to the times of high-intensity rainfall, which indicates that rainfall does not contribute significantly to the recharge of groundwater in this area (ERM-West, 1996). Measurements of evaporation at Boulder City and Lake Mead indicate an annual loss of about 6.5 feet of water, three-fourths of which occurs during the six warmer months. The evapotranspiration within Las Vegas Wash is expected to be significantly higher due to high consumptive use by cattails, warmer temperatures, and lower humidity (Geraghty & Miller, 1993, after USBR, 1982).

Winds are typically out of the southwest or northwest and average nine miles per hour (mph). Gusts greater than 50 mph occur several times a year during the massage of major frontal systems. Topography influences the wind flow patterns.

4.0 LOCATION RESTRICTIONS

4.1 Flood Plains

The proposed BRC CAMU is located in an area determined to be outside the 100-year flood plain (Figure I-1) (FEMA, 2002).

4.2 Fault Areas

The proposed BRC CAMU is not located within 200 feet of a fault that has had displacement in Holocene time. Two north-trending fault scarps are located approximately ½ mile northwest and southwest of the proposed BRC CAMU (Figure I-2) (Converse Consultants, 1999). Displacement on both faults is recorded as pre-Holocene.

4.3 Seismic Impact Zones

The proposed BRC CAMU is located in a seismic impact zone (USGS, 1982). The site is located in an area with a 10 percent or greater probability that the maximum horizontal acceleration in lithified earth material will exceed 10 percent of the earth's gravitational pull in 250 years (USGS, 1982). The maximum horizontal acceleration depicted on the seismic hazard map with a 90 percent or greater probability that the acceleration will not be exceeded in 250 years is 14 percent of the earth's gravity. The peak horizontal ground acceleration recommended for the design of the project is 0.15g (Converse Consultants, 1999). A soil profile type of S_D per Table 16-J of the 1997 Uniform Building Code is recommended for the site.

Structures for containment, including liners, systems for the collection of leachate and systems for the control of surface water, will be designed to resist the maximum horizontal acceleration in lithified earth material for the site. Proof of meeting these design requirements will be placed in the operating records for the site and the solid waste management authority will be notified that the proof has been placed in the operating records.

4.4 Unstable Areas

Portions of the land on which the North Mesa will be constructed have been historically used for waste disposal – namely, the slit trenches. Wastes, consisting of various industrial wastes, construction and demolition debris, and office trash was disposed of in "slit trenches" that were excavated below grade. The Draft Conceptual Site Model prepared by DBS&A details the recent investigation of the "slit trenches" revealing the depth and extent of waste material (DBS&A, 2006). The waste was placed in the trenches without compaction effort and covered with previously excavated native material. There is also evidence that some waste may have been ignited and burned. As a result of the waste being placed without compaction, the "slit trenches" have experienced settlement over the years.

As noted above, the BRC CAMU is sited to overlay the slit trench area, and this overlay will in itself protect the slit trenches from erosion by wind and water. However, the potential for continued settlement of the "slit trenches" may cause instability of the

BRC CAMU liner system, if not addressed. Therefore, engineering measures will be incorporated into the structural design of the BRC CAMU to consolidate (compact) these materials prior to construction of the overlying BRC CAMU liner system. These measures are more particularly specified in Attachment J, CAMU Design- Conceptual.

In addition, it should be noted that BRC expects to excavate certain portions of the slit trenches, based on a Slit Trench Remedial Alternative Study (Slit Trench RAS), which is in preparation. The goal is to remove waste materials in "hot spot" areas within the slit trenches on a preventive basis and to meet regulatory requirements. Locations so excavated will be properly backfilled and consolidated prior to construction of the CAMU.

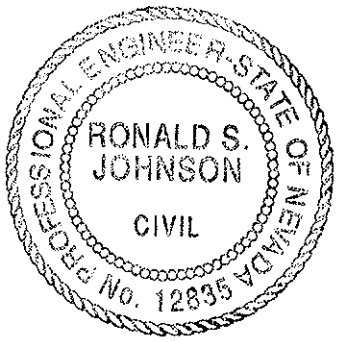
CONCEPTUAL DESIGN FOR
THE CONSTRUCTION OF
THE BASIC REMEDIATION COMPANY
CORRECTIVE ACTION MANAGEMENT UNIT

HENDERSON, NEVADA

The Engineering material and data contained in this Conceptual Design Plan were prepared under the supervision and direction of the undersigned, whose seal as a registered Professional Engineer is affixed below.

The Engineering system in this conceptual design will prevent the migration of any hazardous constituents into the ground water or surface water at least as effectively as the liner and leachate collection and removal system specified in 40 CFR 264.301(c).

Ronald Johnson, P.E.
Nevada No. 12835



1.0 INTRODUCTION

This conceptual design is prepared in accordance with 40 CFR Parts 264, 266 and 268. The technical approaches discussed in this section are intended to outline the key conceptual design features and components of the proposed landfill. Upon regulatory review and approval, the conceptual design will be refined to provide detailed specifications to meet the design standards and performance criteria outlined in this permit.

1.1 Maps and Plans

A series of maps, plans and cross-sections referenced throughout this section is located in Section 1 of the Supplemental RAP Information (SRAPI). The design plans include the following:

- Figure J-1 – Title Sheet and Drawing List (includes general location map).
- Figure J-2 – Legend, Abbreviations, and General Notes;
- Figure J-3 – Overall Site Plan;
- Figure J-4 – Construction Sequence Plan;
- Figure J-5 – Surcharge Plan;
- Figure J-6 – Site Preparation Plan;
- Figure J-7 – Construction Grading Plan;
- Figure J-8 – Storm Drain Plan;
- Figure J-9 – Final Cover Grading Plan;
- Figure J-10 – Cross Sections
- Figure J-11 – Final Cover and Liner Details and Sections;
- Figure J-12 – Fence Plan.

1.2 Anticipated Waste Material

The source materials for the proposed BRC CAMU include approximately 3.7 million cubic yards of residual solids (i.e., sediments and associated soils) from the industrial ponds, ditches, and other source areas within the BMI Common Areas known as the Eastside Area, slit trenches, and western ditch within the BRC CAMU area. Extensive testing of the waste material has determined the majority of wastes to be non-hazardous. Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), and Polychlorinated Biphenyls (PCBs) were detected sporadically, with VOCs and SVOCs throughout the site and PCBs in the Beta Ditch and first eight Upper Pond rows. Pesticides, metals, and cyanide were detected at low levels in the Beta Ditch and first eight Upper Pond rows. Asbestos was tested at measureable levels in the Beta Ditch and first eight Upper Pond rows. These wastes are not incompatible, reactive, or

ignitable. Additional waste characterization detail can be found in the Waste Analysis Plan (Attachment C). No wastes will be accepted from other sources.

Unlike typical landfills, both the source material and the proposed BRC CAMU will be under sole control of BRC. Consequently, there will be direct control over the types of waste materials placed at the BRC CAMU. Physical and chemical descriptions of the anticipated waste materials are presented in the Waste Analysis Plan (Attachment C).

1.2.1 Predicted Leachate Generation

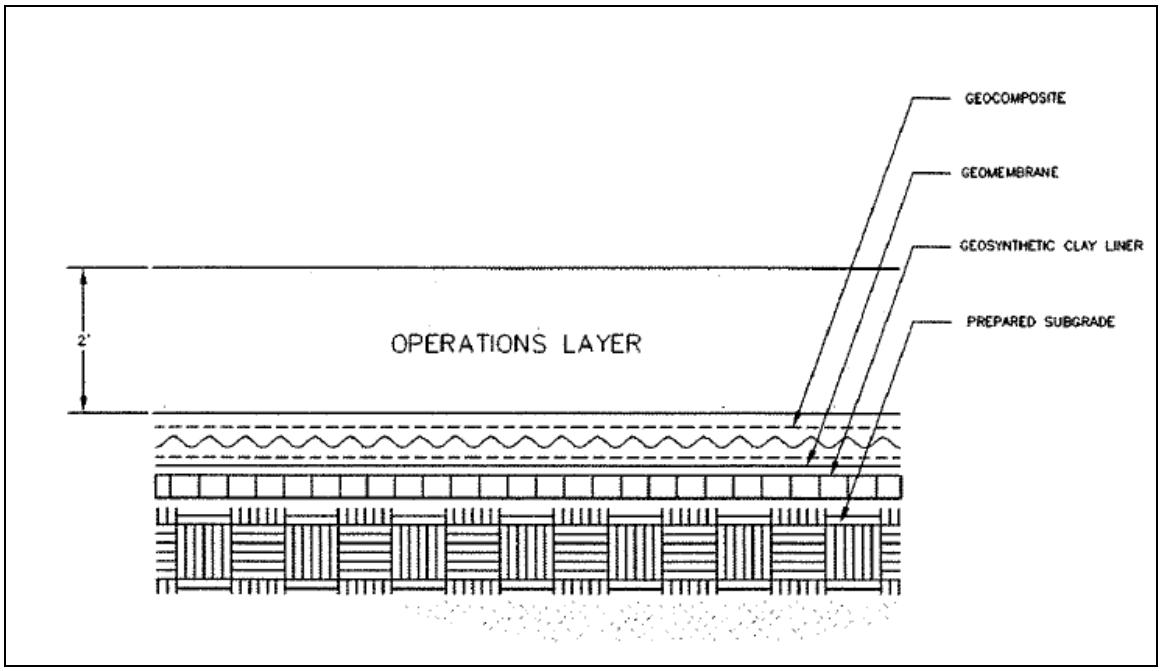
In the case of the proposed BRC CAMU, the mass of waste material will be compacted in place to form a hard-packed, monolithic "block," through which little or no saturated flow is expected to occur. Achieving the most favorable hydraulic conductivity in the compacted sediments depends on the degree of compaction, compaction method, type of soil, soil moisture content, and *in-situ* density. Wet waste sediments from the TIMET ponds will be mixed with dry solids, or otherwise dewatered, and then transported and placed to maintain a moisture content below that which is capable of generating leachate. The process will be designed such that waste sediments placed in the landfill meet the density and moisture content requirements that will in turn reduce leachate generation.

While waste material placed within the landfill will not be intrinsically capable of generating leachate, the ability for the landfill to produce leachate will be dependent on the quantity of the water allowed to infiltrate the interim and final cover materials and penetrate into the underlying waste materials. Therefore, final cover design and operational specifications for interim covers are important for the landfill system to provide for protection of the waters of the state. For this reason, the proposed interim and final cover are designed to reduce infiltration of water as described in Attachment O (Closure and Post-Closure Plan) and Attachment P (Final Cover Design).

2.0 LINER DESIGN

2.1 Liner and Leachate Collection System

A composite liner and leachate collection system is proposed as shown in cross-sections in Detail J-1 below. The composite liner will underlie the waste materials, providing a barrier to the underlying native soils and groundwater. Although leachate generation is not anticipated, this liner system is designed with a leachate collection system to reduce potential liquid accumulation at the base of the waste materials. Liner and leachate collection components will be constructed of materials having appropriate strength and chemical compatibility.



Detail J- 1, Composite Liner Layout

As shown in Detail J-1 above, the liner system is anticipated to consist of the following elements, or layers, from top to bottom: a geocomposite drainage layer, a geomembrane, and a geosynthetic clay liner (GCL). GCLs consist of a layer of bentonite-clay-backed geotextile. GCLs exhibit properties of low permeability soil liners, and have successfully substituted for the soil component in composite liner designs. Placement of a GCL under the geomembrane is commonly employed to increase effectiveness of the composite liner by limiting flow through potential flaws or pinholes in the geomembrane.

Geomembranes are relatively thin sheets of flexible polymeric materials that are manufactured and prefabricated at a factory and transported to the site. Because of their inherent impermeability, use of geomembranes in landfill construction is typically standard in the industry. Geomembranes are made of one or more polymers along with a variety of other ingredients such as carbon black, pigments, fillers, plasticizers, processing aids, crosslinking chemicals, anti-degradants, and biocides. The polymers used to manufacture geomembranes include a wide range of plastics differing in properties such as chemical resistance and basic composition. The polymeric materials may be categorized as follows:

- Thermoplastics such as polyvinyl chloride (PVC);

- Crystalline thermoplastics such as high density polyethylene (HDPE), low density polyethylene (LDPE), and linear low density polyethylene (LLDPE); and

- Thermoplastic elastomers such as chlorosulfonated polyethylene (CSPE).

The polymeric materials used most frequently as geomembranes are HDPE, PVC, and CSPE. Geomembrane thickness range from 20 to 120 mil (1 mil = 0.001 inch). The recommended minimum thickness for all geomembranes is 30 mil, with the exception of HDPE, which must be at least 60 mil. A 60-mil HDPE geomembrane is proposed for the BRC CAMU, which is widely recognized in the industry as a very chemically resistant, durable, long-lasting material.

Geocomposite is to be placed on the geomembrane to protect it from puncture by the overlying operations layer soil. The geocomposite is designed to allow leachate, if generated by the waste materials, to flow toward perforated HDPE collection piping and be collected at the pump-out locations. The base grade of the landfill is engineered to slope toward these leachate collection areas.

Components of the leachate collection system (LCS) will have sufficient strength to support overlying compressive stresses. Pipe strength calculations will include resistance to wall crushing, pipe deflection, and buckling pressure. Perforated drainage pipes have been shown to provide good long-term performance in LCSs (USEPA, 1993).

Geotextile filter is a component of the geocomposite that will reduce physical clogging of the drainage layer from the overlying fine-grained material.

The liner system is intended to work together with other design components to isolate the waste materials from the environment. The main objective of BRC CAMU design is to provide a design that protects waters of the state. Design components that are intended to accomplish this objective are as follows:

1. The final cover, or cap, of the landfill is designed to allow essentially no infiltration of water into the waste materials. The final cover is described in the CAMU (Landfill) Closure and Post Closure Plan (Attachment O). A solar field is contemplated to be installed and operated by a third party on top of the final cover. For additional details see Section 3.0 of the application.

2. The waste material will be processed and compacted to the degree necessary to reduce saturated flow within the interred materials. As discussed earlier, material from the TIMET ponds will be mixed with dry soils or dewatered, as necessary, prior to interment in the BRC CAMU. Together with a cap that reduces infiltration in an arid environment, the

resulting potential for contaminant mobilization and leachate generation is considered minimal.

3. In addition to the above precautions, the underlying liner system will be designed to collect leachate generated, thereby providing an additional factor of safety in reducing waste migration into the groundwater.

4. The base of the landfill will be at least 5 feet higher than first groundwater at the groundwater's highest elevation, providing a buffer between groundwater and the landfill (Appendix A).

Engineering design calculations and construction specifications for the base liner system and leachate collection system are presented with the Supplemental RAP Information (SRAPI), Sections 2 and 4, respectively. A summary is provided in the following section.

3.0 SUMMARY OF ENGINEERING ANALYSIS

3.1 General

This section summarizes the results of the conceptual design calculations performed for the base liner system at the BRC CAMU Landfill site. The following calculations were performed:

- Slope Stability Evaluation - Cut Slopes (Calculation Package A);
- Slope Stability Evaluation - Final Waste Slopes (Calculation Package B);
- Drainage Pipe Size Calculations (Calculation Package C);
- Pipe Strength Calculations (Calculation Package D);
- Veneer Stability Calculations (Calculation Package E);
- Geotextile Separation/Filtration Calculations (Calculation Package F);
- Geotextile Puncture Protection Calculations (Calculation Package G);
- Sump Capacity Calculations (Calculation Package H);
- Comparison of Flow Through the Prescriptive Composite Liner and a Proposed Alternative Composite Liner (Calculation Package I);
- Tension Due to Wind Uplift (Calculation Package J);
- Evaluation of Liner System Anchor Capacity (Calculation Package K);
- Drainage Geocomposite Equivalency Demonstration (Calculation Package L); and
- Consolidation Analyses (Calculation Packages M and N)

The base liner system calculations are based on the conceptual design grading plans shown on Figures J-7 and J-9 Additional calculations may have to be performed if there are changes to elevation and grade in the aforementioned design grading plans.

3.2 Slope Stability Evaluation

3.2.1 General

This section summarizes the analyses performed for the cut slopes and the final waste slopes. The analyses summarized herein are for static stability. Seismic site response, stability, and permanent deformation analyses are presented in Attachment O.

3.2.2 Cut Slopes

Slope stability was evaluated for the proposed cut slopes for the BRC CAMU. One cross-section was analyzed that represents the most critical case. Cut slopes with the highest height, weakest materials, and/or steepest slope are chosen for this analysis. The analyzed native soil cut slope has a height of approximately 44 ft and a base sloping at 3%. The proposed native soil cut slopes are at a slope angle of 2.1:1 (horizontal:vertical). The material properties selected and used in these analyses were based on a preliminary investigation by Converse Consultants, Inc. [Converse, 1999]. The calculations suggest that the most critical potential failure surface of the 2.1H:1V native soil cut slope possesses a factor of safety of approximately 1.5. Since the native soil cut slopes are considered interim, seismic evaluations were not conducted. Native soil cut slope stability calculations are presented in Section 2, Calculation Package A of the SRAPI.

3.2.3 Final Waste Slopes

The stability of the final waste slopes for the BRC CAMU was analyzed. Two cross-sections were analyzed that represent the most critical cases. Similar to cut slope analysis, waste slopes with the highest height, weakest materials, and/or steepest slope are chosen for this analysis. Originally, the analyzed final waste slope has a height of approximately 47 ft above surrounding grades at a slope angle of 3:1 (horizontal:vertical). Waste testing performed during waste placement as described in the Revised Waste Placement and Processing Plan was used to define waste material properties (Geosyntec, 2008). The calculations suggest that an apparent internal or interface friction angle of 11 degrees and 625 psf adhesion for any component of the composite liner system is the minimum allowable value provides a static factor of safety of 2.0. Furthermore, the calculations suggest that the yield acceleration for the final waste slopes is approximately 1.10 g (where "g" is the gravitational acceleration of 32.2 ft/s^2).

Design Change Notifications (DCNs) 47 and 48, issued during construction of the BRC CAMU, increased the height of the CAMU by an additional 34 ft, total. The additional waste was placed with 3H:1V slopes. The increased waste slopes were offset from the original 47 ft waste slopes by a minimum 10 ft wide bench. The material

properties selected and used in the analyses were based on the results of conformance testing performed during construction of the CAMU. The calculations suggest that the minimum interface friction angle of 11 degrees with 625 psf adhesion resulting from interface shear conformance testing for the composite liner system provides a static factor of safety of 2.0. The original and revised final waste slope stability calculations are presented in Section 2, Calculation Package B of the SRAPI.

3.3 Drainage Pipe Size Requirement

Drainage pipes will be placed on the base liner system to collect and transport potential leachate to the sump for removal. Analyses were performed to model leachate generation by using the Hydrologic Evaluation of Landfill Performance (HELP) model. The calculations suggest that a 4-inch diameter pipe with four 1/4-inch perforations spaced at 1-ft intervals will accommodate the flow predicted by HELP model analyses. Larger perforations are permitted if pipes are wrapped in filter geotextile to limit drainage rock intrusion. Drainage pipe size calculations are presented in Section 2, Calculation Package C of the SRAPI.

3.4 Pipe Strength

Based on drainage pipe size analyses, a 4-inch diameter drainage pipe will be used for leachate collection and transport. 12- and 18- inch diameter pipes will be used for the side slope riser for the vadose zone and leachate collection sumps, respectively. Based on the calculations performed for the 4-inch diameter drainage pipe and the 12- and 18-inch diameter side slope riser, the appropriate standard dimension ratio (SDR) is 13.5 or smaller. This calculation assumes the maximum height above the pipe of waste is 93 ft (South Mesa). Pipe strength calculations are presented in Section 2, Calculation Package D of the SRAPI.

3.5 Veneer Stability

The design criteria for the side slope liner system is to develop zero tension in the geosynthetics during installation of the operations layer on the side slopes. Potential causes of tension in the liner system include construction equipment loading and overburden stresses (e.g., operations layer materials). Based on the proposed grades and expected construction conditions, the calculations suggest that the side slope liner system will not be placed into tension provided a minimum dry interface friction angle of 18 degrees is maintained and the operations layer is staged in 10-ft high increments inclined at 2.5H:1V. Veneer stability calculations are presented in Section 2, Calculation Package E of the SRAPI.

3.6 Geotextile/Separation/Filtration Requirements

A separation/filtration geotextile will be placed between the operations layer and the drainage aggregate surrounding the leachate collection pipe and as a component of the geocomposite drainage layer. The purpose of the geotextile is to limit migration of fine material from the operations layer into the drainage aggregate and/or geonet component of the geocomposite. The calculations suggest that the separation/filtration geotextile overlying the drainage aggregate layer has an apparent opening size (AOS) greater than Sieve No. 70, a permittivity greater than 0.8 sec^{-1}, a minimum mass per unit area of 6 $oz./yd^2$, and sufficient mechanical properties. Geotextile separation/filtration calculations are presented in Section 2, Calculation Package F of the SRAPI.

3.7 Geotextile Cushion Protection

The geomembrane needs to be protected from puncture by particles from the prepared subgrade and operations material. Based upon the selection of using a geocomposite as the drainage layer in the leachate collection system, the geocomposite is selected such that the combined weight of the geocomposite geotextiles will act as an equivalent cushion. With respect to subgrade puncture, the geotextile components of the GCL will protect the geomembrane from the prepared subgrade. This calculation is based on a maximum overburden height of 93 feet. The analysis suggests that the following maximum particle sizes and geotextile mass per unit areas will be required:

Soil Component of Liner	Maximum Particle Size	Minimum Mass per Unit Area
Subgrade	0.75 inch	9 $oz./yd^2$ (GCL)
Angular Drainage Aggregate	1.00 inch	16 $oz./yd^2$

Table J -1- Cushion Geotextile requirements

Geotextile cushion protection calculations are presented in Section 2, Calculation Package G of the SRAPI.

3.8 Sump Capacity

The USEPA regulations limit the head over the liner system to less than 12 inches. Therefore, the available capacity to retain the peak daily runoff includes the sump and the volume of 12 inches of leachate in the geocomposite and operations layer extending away from the sump. The maximum, average daily runoff calculated from the HELP model analyses (see drainage pipe sizing calculation) is 231 ft^3. A sump will be located at four low points (Phases I, II, IIIB, and V). Each sump will be approximately 10 ft x 10 ft x 2 ft deep. The sump has a capacity of approximately 112 ft^3. The capacity of the drainage geocomposite/operations layer extending away from the sump (at a 12-inch head) is greater than 342 ft^3. The combined capacity of the sump and drainage

geocomposite/operations layer is 453 ft^3, which exceeds the maximum, average daily runoff noted above of 231 ft^3.

The capacity of the four sumps located throughout the site will be able to accommodate the anticipated peak daily flow (as evaluated from the HELP model – drainage pipe sizing calculation, Section 2, Calculation C of the SRAPI) and meet the EPA requirement of less than 12 inches of head over the liner. Sump and drainage aggregate capacity calculations are presented in Section 2, Calculation Package H of the SRAPI.

3.9 Comparison of Flow Through a CCL and GCL

The calculations suggest that the flow rate through the prescriptive composite liner system containing a compacted clay liner (CCL) is approximately 1.64 times greater than the flow rate through the alternative composite liner system containing a geosynthetic clay liner (GCL). The comparison calculations are presented in Section 2, Calculation Package I of the SRAPI.

3.10 Tension Due to Wind Uplift

The most critical scenario for wind uplift is after the 10-ft vertical height of operations material has been placed against the slope while the remainder of the geosynthetic liner is exposed on the upper portion of the slope. A UV-protective woven geotextile will be installed to overlie the exposed portions of geosynthetics on these cut slopes. The woven geotextile will be subjected to tension due to wind uplift.

Due to proximity of the site, the Las Vegas Airport wind speed data was used for this analysis. A design wind speed of 90 mph is used, which is the peak gust recorded since 1961. This is a conservative design wind speed since the likelihood of this wind speed occurring during the period of construction is very low. Assuming the design wind speed, the calculations suggest that the maximum tension the woven geotextile will experience is 82.8 lb/in. In order to resist the uplift forces from wind loads, the woven geotextile shall have a minimum ultimate wide width tensile strength of 110 lb/in. The tension due to wind uplift calculations is presented in Section 2, Calculation Package J of the SRAPI.

3.11 Anchorage Capacity

The geosynthetics' anchor must have the capacity to withstand potential pullout tension due to wind uplift from the UV-protective woven geotextile. The proposed anchor consists of a 2-ft wide and 2.5-ft deep trench filled with compacted soil. The anchor trench will be overlain by 1 ft of soil with a 3-ft runout length from the top of

slope. The capacity of the anchor trench is sufficient to withstand pullout tension from the woven geotextile. The anchorage capacity calculations are presented in Calculation Package K.

3.12 Geocomposite Equivalency Demonstration

A geocomposite layer will be used in lieu of a leachate collection gravel and separation/filtration geotextile. A geocomposite layer, consisting of two 8 oz/yd^2 nonwoven geotextiles bonded to either side of a geonet, is proposed. The top geotextile shall conform to the requirements presented in the geotextile separation/filter calculation package (Section 2, Calculation Package F in the SRAPI). The combined weight of the geotextiles will act as an equivalent cushion. The calculations suggest that a drainage composite will provide equivalent transmissivity to the aggregate drainage layer. The geocomposite equivalency demonstration calculations are presented in Section 2, Calculation Package L of the SRAPI.

3.13 Consolidation Analysis

Consolidation analyses were performed to evaluate the potential affect on the performance of the proposed liner system under increased loads related to the BRC CAMU. Borings and associated laboratory test results were used for locations beneath the South Mesa (higher loads due to thicker waste profile). Conservative analyses suggest that consolidation will not adversely impact the performance of the proposed liner or leachate collection systems. The consolidation analysis for the South Mesa is presented in Section 2, Calculation Package M of the SRAPI.

In addition, a consolidation analysis was performed to evaluate the effects of the consolidation settlement of waste in the “slit trenches” that will be overlain by the North Mesa disposal area. This evaluation was performed prior to the decision to remove the slit trench waste, place the waste in the CAMU, and backfill the excavations to original grade.

The consolidation analysis is presented in Section 2, Calculation Package N of the SRAPI.

Subject: Groundwater Elevations
BRC CAMU
Henderson, Nevada

Dear Dr. Sahu:

In accordance with the Nevada Department of Environmental Protection (NDEP) draft Notice of Deficiency (NOD) dated 13 February 2007, Geosyntec has evaluated the groundwater elevation data associated with the Basic Remediation Company Correction Action Management Unit (CAMU) located in Henderson, Nevada. The proposed CAMU liner system, as illustrated on Drawing J-7, is designed to be a minimum of 5 feet above the groundwater elevation. The groundwater elevations presented on Drawing J-7 were obtained by Montgomery Watson Harza (MWH) in July 2005.

Based on the groundwater contours provided by MWH, the north mesa portion of the CAMU (i.e., the portion over the slit trenches) liner system is greater than approximately 40 feet above groundwater and the south mesa portion of the CAMU liner system (i.e., in the borrow pit area) greater than 5 feet above groundwater. Approximately 93% of the south mesa portion of the CAMU liner system area is more than 10 feet above the groundwater.

The CAMU liner system is designed to limit migration of liquids in the CAMU to the groundwater, which will also limit the migration of groundwater into the CAMU if groundwater were to rise above the base liner system elevation. Furthermore, if groundwater were to rise to an elevation above and migrate through the CAMU liner system, the liquid would be collected in the leachate collection and removal system and would then be removed from the landfill as outlined in the operations plan.

Based on this information, we do not anticipate that rising groundwater levels, if they occur, would adversely impact the performance of the liner system or CAMU.

Sincerely,

Ronald S. Johnson, P.E.
Associate Engineer

1.0 INTRODUCTION

This BRC CAMU Construction Plan outlines the general construction requirements and schedule for the base liner systems. This plan addresses the construction materials, installation, and grading requirements for the BRC CAMU. The rationale for selecting the liner materials is described in the supporting calculations. A Base Liner System Construction Quality Assurance (CQA) plan, base liner system technical specifications, and conceptual drawings are included with the Supplemental RAP Information (SRAPI).

2.0 LINER CONSTRUCTION SCHEDULE AND SEQUENCE

Construction of the CAMU components will be phased so as to increase efficiency of waste disposal. One unit of the BRC CAMU will receive wastes while the base liner system is being constructed for the next unit. These different sections will be divided using storm water controls to reduce surface water, leachate, and waste interaction. The liners in adjacent units will be joined using the seaming techniques outlined in the Base Liner CQA and Technical Specifications (Sections 3 and 4 of the SRAPI, respectively). As lined areas are completed with waste placement, they will be closed and the final cover system will be constructed, as discussed in the CAMU (Landfill) Closure and Post-Closure Plan (Attachment O).

The general construction sequence of the CAMU, as shown on Figure J-4 of the Conceptual Drawings, Section 1, in the SRAPI, is outlined in the following sections.

2.1 Site Preparation

The site will be prepared by removing surface vegetation and portions of the fence currently on site. The temporary perimeter fence will be established and all support facilities brought on-site. At this time, the haul roads and storm water controls (ditches, culverts, silt fences, check dams, and basins) will be constructed. The slit trenches will be excavated, waste disposed of within the CAMU, and backfilled. The liner foundation will be graded in accordance with the Conceptual Drawings to prepare for liner installation. The grading requirements are summarized in Section 3 of this Attachment and in shown detail in Section 1 of the SRAPI.

2.2 Liner Installation

After the liner foundation grading, the leachate collection system and liner installation will begin. The flowlines, sumps, and berms for leachate conveyance and

storage will be constructed as shown on the Drawings at this time. Liner construction will begin with the installation of the geosynthetic clay liner (GCL), and geomembrane. Requirements for installation are summarized in Section 3 of this Attachment and in detail in the SRAPI.

2.3 Leachate Collection and Removal System Installation

The leachate collection and removal system will be installed next, with collection pipes, drainage aggregate, geotextile, and geocomposite. The geocomposite and filter geotextile will be overlain with 2 feet of soil acting as an operations layer. Requirements of the geocomposite and filter geotextile are summarized in Section 3 of this Attachment and in detail in the SRAPI.

3.0 LINER CONSTRUCTION REQUIREMENTS

3.1 General

This section describes the construction requirements for installation of the base liner system at the BRC CAMU. These construction requirements are necessary in order to ensure that the construction of the liner system is consistent with the design performance goals and assumptions.

3.2 Slope Inclinations

Native soil cut slopes shall be excavated no steeper than a slope inclination of 2.1H:1V. Waste soil slopes shall be placed no steeper than a slope inclination of 3H:1V.

3.3 Drainage Pipe Size Requirement

In accordance with the analyses performed, the drainage pipe shall be 4-inch diameter HDPE pipe with four 1/4-inch perforations per foot of pipe. Larger perforations are permitted if the pipe is wrapped in a geotextile fabric to prevent drainage rock intrusion. The side slope riser pipes shall be 12 – and 18-inch diameter HDPE solid-wall pipe for the vadose zone monitoring and leachate collection sumps, respectively. The standard dimension ratio (SDR) for the 4-inch diameter pipe and the 12- and 18-inch side slope risers shall be less than or equal to 13.5.

3.4 Equipment Loading

Equipment loads shall be limited to a maximum loading of 5 psi overlying a minimum of 1 ft of operations materials. In addition, roads for haul trucks shall be a minimum of 3 ft in thickness overlying the liner system.

3.5 Geotextile Requirements

Two geotextile components of the base liner system are utilized, a 6 oz/yd^2 separation/filtration geotextile and a 16 oz./yd^2 cushion geotextile. A UV protective geotextile will be used on the exposed liner system components on the side slopes. To ensure proper manufacturing and durability, the 6 oz/yd^2 separation/filter geotextile shall have the following properties:

Matrix	Nonwoven
Mass per Unit Area	≥ 6 oz/yd^2
Apparent Opening	≤Sieve No. 70
Permittivity	≥ 0.8 sec-1
Grab Strength	≥ 130 lb
Puncture Strength	≥ 40 lb
Ultraviolet strength retention	≥ 70%

The 16 oz/yd^2 cushion geotextile shall have the following properties:

Matrix	Nonwoven
Mass per Unit Area	≥ 16 oz/yd^2
Puncture Strength	≥ 155 lb
Grab Strength	≥ 350 lb
Ultraviolet strength retention	≥ 70%

The UV protective layer woven geotextile shall have the following properties:

Matrix	woven
Wide Width Tensile Strength	≥ 110 lb/in (ultimate strength)
Apparent Opening	≤ Sieve No. 40

3.6 Geosynthetic Clay Liner (GCL)

The GCL component of the base liner system shall have the following properties:

- Index flux > 1.0×10^{-8} ft^3/ft^2-sec;
- Minimum interface shear strength of 12 degrees;
- The GCL shall be dry during installation; and
- combined geotextile mass per unit area of 9 oz/yd^2.

3.7 Leachate Collection Layer

3.7.1 Geocomposite Requirements

In lieu of using drainage aggregate, a geocomposite will be used to collect potential leachate. The selected geocomposite shall have the following properties:

- Transmissivity > 3.05×10^{-5} ft^2/sec under a confining pressure of 12,000 psf and a hydraulic gradient of 0.10;
- an 8 oz/yd^2 non-woven geotextile bonded to each side of the geonet; and
- the top 8 $oz./yd^2$ non-woven geotextile shall have an AOS greater than Sieve No. 70, permittivity greater than 0.6 sec-1, and sufficient mechanical properties.

3.7.2 Geomembrane Requirements

The geomembrane shall be high-density polyethylene (HDPE), have a nominal thickness of 60 mil, and be textured on both sides.

3.8 Prepared Subgrade Requirements

The prepared subgrade shall have a maximum exposed particle diameter less than 3/4 inch.

4.0 RECORDS AND RECORDKEEPING

4.1 General

Liner and Leachate Collection System construction records will be kept in accordance with the CQA plan. The CQA Site Manager will document that all quality assurance requirements have been addressed and satisfied.

The CQA Site Manager will provide BRC with signed descriptive remarks, data sheets, and logs to verify that monitoring activities have been carried out. The CQA Site Manager will also maintain, at the job site, a complete file of Drawings and Technical Specifications, a CQA Plan, checklists, test procedures, daily logs, and other pertinent documents.

4.2 Daily Recordkeeping

Preparation of daily CQA documentation will consist of daily reports prepared by the CQA Site Manager which will include CQA monitoring logs, and testing data sheets. This information may be regularly submitted to and reviewed by BRC.

The CQA Site Manager will prepare daily reports that document the activities observed during each day of activity. The daily reports may include monitoring logs and testing data sheets. At a minimum, these logs and data sheets will include the following information:

- the date, project name, location, and other identification;
- a summary of the weather conditions;
- a summary of locations where construction is occurring;
- equipment and personnel on the project;
- a summary of meetings held and attendees;
- a description of materials used and references of results of testing and documentation;
- identification of deficient work and materials;
- results of re-testing corrected “deficient work;”
- an identifying sheet number for cross referencing and document control;
- descriptions and locations of construction inspected;
- type of construction and inspection performed;

- description of construction procedures and procedures used to evaluate construction;
- a summary of test data and results;
- calibrations or re-calibrations of test equipment and actions taken as a result of re-calibration;
- decisions made regarding acceptance of units of work and/or corrective actions to be taken in instances of substandard testing results;
- a discussion of agreements made between the interested parties which may affect the work; and
- signature of the respective CQA Site Manager.

4.3 Construction Problems and Resolution Data Sheets

Construction Problems and Resolution Data Sheets, to be submitted with the daily reports prepared by the CQA Site Manager, describing special construction situations will be cross-referenced with daily reports, specific observation logs, and testing data sheets and will include the following information, where available:

- an identifying sheet number for cross-referencing and document control;
- a detailed description of the situation or deficiency;
- the location and probable cause of the situation or deficiency;
- how and when the situation or deficiency was found or located;
- documentation of the response to the situation or deficiency;
- final results of responses;
- measures taken to prevent a similar situation from occurring in the future; and
- signature of the CQA Site Manager and a signature indicating concurrence by BRC.

BRC will be made aware of significant recurring nonconformance with the Drawings, Technical Specifications, or CQA Plan. The cause of the nonconformance will be determined and appropriate changes in procedures or specifications will be recommended. These changes will be submitted to the Engineer for approval. When this type of evaluation is made, the results will be documented and revision to procedures or specifications will be approved by the Contractor and Engineer.

4.4 Photographic Documentation

Photographs will be taken and documented in order to serve as a pictorial record of work progress, problems, and mitigation activities.

4.5 Design Changes

Design changes may be required during construction. In such cases, the CQA Site Manager will notify BRC. Design changes will be made with the written agreement of BRC and the Engineer and will take the form of an addendum to the Drawings and Technical Specifications. Design changes will be included in the CQA Reports.

4.6 CQA Report

At the completion of the Project, the CQA Consultant will submit to BRC the CQA report signed and sealed by a Professional Engineer licensed in the State of Nevada. The CQA report will acknowledge: (i) that the work has been performed in compliance with the Drawings and Technical Specifications; (ii) physical sampling and testing has been conducted at the appropriate frequencies; and (iii) that the summary document provides the necessary supporting information. At a minimum, this report will include:

- Manufacturers' quality control documentation;
- a summary report describing the CQA activities and indicating compliance with the Drawings and Technical Specifications which is signed and sealed by the CQA Officer;
- a summary of CQA/CQC testing, including failures, corrective measures, and retest results;
- contractor personnel resumes and qualifications;
- documentation that the geomembrane trial seams were performed in general accordance with the CQA Plan and *Technical Specifications*;
- documentation that field seams were non-destructively tested using a method in general accordance with the applicable test standards;
- documentation that nondestructive testing was monitored by the CQA Consultant, that the CQA Consultant informed the Geosynthetic Installer of any required repairs, and that the CQA Consultant inspected the seaming and patching operations for uniformity and completeness;
- records of sample locations, the name of the individual conducting the tests, and the results of tests;

- record drawings as provided by the Surveyor;
- documentation showing that piping was tested in general accordance with the Technical Specifications; and
- daily inspection reports.

The record drawings will include scale drawings depicting the location of the construction and details pertaining to the extent of construction (e.g., depths, plan dimensions, elevations, soil component thicknesses). Base maps required for development of the record drawings and the record drawings themselves will be prepared by a qualified Professional Land Surveyor registered in the State of Nevada. These documents will be reviewed by the CQA Consultant and included as part of the CQA Report, which will be kept with the project records in accordance with the records retention requirement of the AOC3.

1.0 INTRODUCTION

The purpose of this Operation Plan is to delineate the procedures and operating practices that will be implemented to ensure the safe and efficient excavation, loading, transportation, receipt, and placement of remediation wastes at the BRC CAMU. This Operation Plan summarizes operational procedures discussed in detail in the Corrective Action Plan (CAP) for the BRC Common Areas Remediation Project prepared by Dr. Ranajit Sahu, C.E.M. for BRC dated September 2006. This Operation Plan is intended to provide guidelines to the operator and managers of the BRC CAMU in conducting CAMU operations.

2.0 FACILITIES

2.1 Equipment

The proposed equipment at the BRC CAMU is listed in Table 3 of the CAP. The equipment will be adequate in type, capacity and number, and sufficiently maintained to permit the site operation to meet requirements of these standards. Periodically, the overall maintenance level of site equipment and the quality of site maintenance facilities will be evaluated. In addition, periodically the size and adequacy of the equipment to carry out operations, including the types and quantities of major landfill equipment such as bulldozers, scrapers, compactors, graders and water trucks will be evaluated by BRC.

Selection of type, size, quantity, and combination of machines required to move, dry, spread, and compact waste depend on the following factors:

- Amount and type of waste to be handled;
- Weather conditions;
- Compaction requirements;
- Site and soil conditions (topography, soil moisture, and difficulty of excavation); and
- Supplemental tasks such as maintaining roads, assisting in vehicle unloading, and moving other materials and equipment around the site.

In addition to the above, BRC is committed, through either purchase or lease, to provide other equipment to serve as replacements, backups, or supplements to existing operations, or for such special needs that may arise.

2.2 Operation Support

Suitable shelter and sanitary facilities will be provided for operating personnel and waste transport personnel. In addition, a storage area will be provided for BRC CAMU operators to store equipment.

2.3 Access, Traffic Control, and Roads

Site access will be gained through the entry gate located off Warm Springs Road on the west side of the property. Access will be controlled fencing during site operations in order to prevent unauthorized vehicular traffic and illegal dumping. Access will also be controlled by using artificial barriers to protect public health, safety, and the environment. The entry gate will be equipped with a lockable mechanism to prevent unauthorized entry and/or uncontrolled waste deposition when the site is closed. Access to the site at points other than the entry gate will be discouraged by maintenance of site perimeter fencing and full time security during site operations.

Temporary roads will be provided as necessary to the working face. All roads will be passable during inclement weather. The entire site will be enclosed with a continuous chain link fence. Figure F-1 through F-3 of the CAP show the locations of the proposed haul roads.

2.4 Signs

At the main entrance gate off Fourth Street a sign will be posted indicating the following:

- Facility name;
- The owner and operator of the site;
- The hours of operation; and
- Materials accepted or excluded.

It will be noted on the signage that the BRC CAMU is a private operation.

Instructional signs will be placed at this site entrance addressing prescribed safety measures on the site and include instructions regarding prohibition of smoking within the disposal areas and mandating that all instruction from site personnel be obeyed.

Interior site haul roads will be appropriately signed so as to direct each load to its designated disposal area. Typical directional and information signs will be posted at the site. Location of signage may be changed from time-to-time to facilitate operations.

In addition, authorized personnel may be utilized to direct traffic at the active working face of the landfill operation.

"No Trespassing" signs will be posted at 100-foot intervals along the site perimeter fencing. "Danger- Unauthorized Personnel Keep Out," will be posted at each entrance to the active portion of the BRC CAMU and additional locations as necessary. All signs will be posted in English and Spanish.

Additional signs and/or measures may be required to protect personnel and public health and safety.

3.0 OPERATING CRITERIA

This section presents operating criteria of the BRC CAMU and methodologies to be used to meet such criteria.

3.1 Health and Safety

All activities will be performed in accordance with a Health and Safety Plan(s) (HASP) developed for Site remediation activities by the contractor(s) selected for the project. These HASP(s) shall apply to the contractor's employees and subcontractors. The parameters and details that will be included in the HASP are described in the Accident Prevention, Contingency, and Emergency Response Plan. Briefly, the HASP shall include the following:

- Identification of chemical and physical hazards associated with the remediation activities;
- Minimum training requirements for site workers;
- Minimum Personal Protective Equipment (PPE) for site workers and visitors and criteria for upgrades;
- Air monitoring requirements for workers' breathing zone and site perimeter (for public protection);
- Emergency information, such as emergency telephone numbers and directions to the nearest hospital; and
- Administrative requirements, such as documentation of training, daily health and safety tailgate meetings, and documentation of air monitoring.

A sample Health and Safety Plan table of contents for the BRC CAMU and the Common Areas Remediation Project is included as Appendix D of the CAP.

3.2 Fire Prevention

Fire hazard at the BRC CAMU is expected to be minimal due to the type of material being landfilled. Explosive gases (e.g. methane) are not anticipated at the BRC CAMU because putrescible material will not be accepted at the BRC CAMU for disposal.

No open burning of wastes will be allowed at this site. Fire control protection will be provided by the utilization of on-site equipment such as a water truck, track type dozer and front-end loaders for wetting and smothering accidental fires. In addition, site-related operational vehicles will be equipped with fully functional fire extinguishers. Backup fire protection will be available from units of the Clark County Fire Department.

Site personnel will receive periodic on-the-job training in fire fighting practices conducted by BRC and/or other authorized representatives.

3.3 Control of Windblown Material

Scattering of papers, plastic, or other debris by the wind will not be an issue at the BRC CAMU as such types of wastes will not be accepted. However, minor amounts of paper waste were encountered during slit trench waste excavation and subsequent disposal in the BRC CAMU. BRC used litter fences and hand labor to control windblown waste materials.

Dust control measures will be implemented to limit the amounts of wind-blown dust. Dust control will be accomplished via moisture management and synthetic covers, as required. Operations will cease during periods of high winds, consistent with Clark County requirements as provided in the Dust Control Plan Application included in the CAP.

3.4 Special Waste Disposal

The projected mix of wastes to be received from the service area is a by-product of industrial process fluids allowed to settle in various evaporation ponds. The resulting residual soil is the solid waste requiring disposal. In addition, solid waste from the slit trench excavations will be placed in the BRC CAMU. No other special wastes are anticipated.

3.5 Control of Authorized and Unauthorized Waste

The source materials for the BRC CAMU include the residual solids (i.e., sediments and associated soils) from the industrial ponds, ditches, and related source areas, and slit trench waste from the BRC CAMU area. Municipal wastes will not be accepted from private individuals. Unlike typical landfills, both the source material and

the BRC CAMU will be under sole control of BRC. Consequently, there will be control over the types of waste materials accepted at the BRC CAMU.

3.6 Disposal of Liquids

Liquids will not be disposed of at the BRC CAMU.

3.7 Control of Explosive Gas

Due to the nature of material to be placed in the landfill, generation of methane or other explosive gases is not anticipated. Controls for explosive gas are not required.

3.8 Disposal of Vegetation

Vegetation, if any, will be removed from excavation areas and access routes. Soil attached to plant roots will be shaken loose and left on the ground surface in the pond in which the vegetation was present, to be collected with the other soils in that pond. The vegetation will be relocated and temporarily stockpiled within the Debris Storage Area, as discussed in the CAP, where it will be tested to determine whether chemicals within the site soils have bioaccumulated within the vegetative matter at levels that would cause it to be unsuitable for disposal at a municipal landfill. In the event that vegetation meets disposal requirements in municipal landfills, they will be so disposed. In the event that contaminate levels dictate that they should be disposed in hazardous waste landfills, they will so be disposed. Vegetation grubbed during excavation will not be disposed in the BRC CAMU unless approved by the Design Engineer.

3.9 Compliance with State Implementation Plan

BRC will ensure that the BRC CAMU does not violate applicable requirements developed by the state implementation plan, if any, approved or adopted by the Administrator of the USEPA, pursuant to Section 110 of the Federal Clean Air Act, as amended (42 U.S.C. § 7410), and the regulations adopted pursuant thereto. As noted earlier, dust mitigation will be ensured by adherence to the Dust Mitigation Plan Application, Appendix C of the CAP. In addition, there will be no open burning of solid wastes at the BRC CAMU.

3.10 Putrescible Wastes and Vector Control

Due to the nature of material to be placed in the BRC CAMU, putrescible wastes and vector control issues do not apply.

3.11 Nuisance Control

The operation and maintenance of the BRC CAMU will be in a manner which will not create odors, unsightliness or other nuisances. There will be no ponded and stored water at the site; thus this source of obnoxious odors and vector breeding is obviated.

As necessary, water or other dust palliatives such as magnesium chloride will be applied to the landfill and its roads to minimize nuisance dust consistent with the Dust Mitigation Plan.

3.12 Disposition, Compaction, and Coverage

Since the waste to be disposed will be soil and sediment a daily cover will not be required to control disease vectors, fires, odors, blowing litter and scavenging. Instead, if operations cease for prolonged periods of time, which is not expected, an intermediate cover will be applied on an as-needed basis. Moisture will be added periodically as needed to reduce dust and particulates.

Solid wastes will be spread and compacted in layers. Waste will be offloaded from the haul vehicles, and spread by a tracked dozer in lifts with a maximum thickness of eighteen inches. A landfill compactor or other suitable equipment will accomplish a sufficient number of passes over each lift in order to reduce voids and produce a compact mass.

The BRC CAMU will be operated to facilitate efficient placement of the waste material. At any given time, the compacted waste mass will be contoured to allow effective drainage in case of inclement (rainy) operations. Construction Sequence Plan, included in the Supplemental RAP Information, presents general steps of landfilling activities.

Horizontal and vertical control is necessary to ensure that the final grades and cell geometry are constructed as planned. The BRC CAMU will be filled to within two feet of the required final elevation. Elevation control for equipment operators at the landfill is achieved through the use of steel pipe grade poles installed in the fill area and marked with red rings against a yellow background at the fill level (two feet below the final grade). The ring elevations are surveyed with respect to a BRC CAMU surveyed benchmark, which will be a concrete monument.

3.13 Miscellaneous Requirements for Operation

Scavenging through waste at the working face of the BRC CAMU by citizens or non-employees of the landfill operations will be prohibited and is not expected.

The working face area will be inspected daily and lightweight debris will be returned to the fill area and covered.

Provisions will be established concerning recording all solid waste delivered to the site. Topographic surveys will be performed on a quarterly basis to double-check and further quantify the volume of materials placed within the BRC CAMU.

Damage to areas or components of the BRC CAMU that affect system performance in meeting engineering design objectives will be repaired within 60 days of discovery of the damage.

3.14 Control of Erosion, Mud and Dust

An adequate amount of water from storm water or municipal well sources will be available at all times for the control of dust and the compaction of cover material.

Adequate measures will be taken to minimize the creation of dust and minimize safety hazards due to obscured visibility. Roadways will be sprayed with water and/or magnesium chloride to reduce dust generation. Dust control measures are described in detail in the Dust Mitigation Plan Application which is provided as Appendix C of the CAP.

Primary interior roadways will be surfaced with compacted crushed stone or gravel materials, as necessary. Ramps and unloading areas at designated interior disposal areas will be graded for proper drainage with earth-moving and grading equipment.

During periods of wet weather, such surfacing and maintenance practices will be eliminated, or at least minimized to reduce the tracking of mud off-site. During wet periods, BRC or his/her designee will be responsible for a daily inspection of the main incoming road and will be responsible for the timely removal of any accumulated mud on that portion of the roadway within the immediate site vicinity. In addition, temporary shaker plates will be installed to minimize tracking of mud off site. Accumulated mud deposits remaining on interior haul road surfaces will be similarly removed as needed by light grading to control dust emissions resulting from normal traffic.

3.15 Run-on and Runoff Control Systems

BRC will provide a system to control run-on and runoff of surface water as outlined in the Technical Drainage Study for Eastside Landfill (ATKINS, 2006). The

goal of the run-on system is to collect and control the flow of surface waters entering the BRC CAMU boundaries.

Runoff from the active portion of the BRC CAMU will be managed so as to not cause a discharge of pollutants, silts, or a nonpoint source of pollution from the BRC CAMU into the waters of the state or waters of the United States, including wetlands. Surface water runoff throughout the active portion of the site will be managed to minimize contact of water with solid waste.

Rainfall within the BRC CAMU will be drained away from the active working face. Such drainage will be maintained by constructing each disposal area bottom, or floor, on a uniform grade, with the working face progressing in a downslope direction.

Water coming into contact with the active working face, and thus retained within the BRC CAMU, will be evaporated or may be used for such on-site activities as waste compaction and dust control within the BRC CAMU lined areas. Water not coming into contact with the active working face and collected in the downslope portions of designated water disposal areas may be utilized for such site-related operations as dust control, waste compaction, windblown dust minimization, construction and compaction of disposal area liners, and maintenance of access roadways.

All interim surface water runoff and post closure runoff from the site and surrounding areas will be managed through a series of permanent perimeter drainage channels (Figure J-8). Natural drainage patterns or discharge quantities associated with the site and surrounding areas will not be significantly altered. Runoff will be periodically sampled and tested for general compliance with Nevada National Pollution Discharge Elimination System (NPDES) permit standards.

3.16 Leachate

During waste placement activities, the leachate will be removed from the sumps using portable submersible pumps and will be used for dust control on waste materials placed within the lined limits of the BRC CAMU. Leachate levels will be monitored in accordance with the Final Leachate Monitoring Plan (Attachment Z).

3.17 Decontamination

The Contractor will inspect the equipment to confirm that the equipment arrives on the site in a clean state. If obvious indications of contamination are observed, the Contractor will refuse entrance of the equipment onto the site, or decontaminate the equipment before it is used subject to the approval of BRC. No personal vehicles, "lunch wagons" or other non-essential vehicles will be permitted within the area of active work where the potential to encounter waste may occur. Vehicular traffic will be kept to a minimum. To the extent practical, equipment will be stored when not in use in the location last used or the nearest safe location. Overnight staging in clean areas is not permitted unless the equipment is first decontaminated to prevent the potential for tracking contamination back and forth across the site.

The Contractor will operate the equipment in a manner that minimizes contact with waste, including minimizing the surface area contacting waste and minimizing the potential for spills, drips, splashes or sprays. Equipment, once decontaminated, will be stored in a designated clean area of the site, or preferably removed from the site as soon as practicable.

As described in the CAP, construction equipment decontamination is summarized as follows:

- Transport trucks will be driven across gravel track out aprons with scraping of mud and/or use of water spray to be performed at dedicated decontamination areas.
- Equipment heavily caked with soil and/or other material will be scraped off with a flat-bladed scraper. The scrapings will be placed in the soil staging area for disposal with the excavated soils.
- Equipment will be decontaminated using steam cleaning equipment prior to departure from the work site.

The dozer blades and tracks, and compactor wheels and drum will require decontamination only when removed from the surface of the waste. The frequency of decontamination will be a field decision based on the type of waste materials being encountered.

4.0 REMEDIATION

This section summarizes the excavation procedures, the methods for transporting soils to the BRC CAMU, and documentation which are discussed in detail in the CAP. The BRC CAMU has been sized to contain approximately 3.7 million cubic

yards of material. In the event that impacted soils volume is exceeded, those excess soils will be dispose of off-site, at a properly-licensed facility.

4.1 Soil Excavation

A BRC contractor will complete the excavations in accordance with the plans and specifications developed for this work, under the direction of the BRC. Soil excavation will be performed as described in the CAP. The contractor will use appropriate construction equipment to excavate, load, and transport the materials to the BRC CAMU.

BRC anticipates that 7,500 cubic yards of soil will be excavated, transported, and interred, on average, each day, with the actual volume dependent on equipment used, daily conditions, and hours of operation.

4.2 Soil Transportation to BRC CAMU

All transportation of the remaining small amounts of waste, to be interred in Phase V, will be completed during daylight hours. Hauling will take place using street legal trucks across public roadways.

Soils excavated from the Eastside area will be transported by truck to the BRC CAMU approximately 1.5 to 2 miles away as discussed in the CAP.

Trucks hauling waste materials from the Eastside Area will enter the BRC CAMU Area from the eastern site ingress/egress at 4th Street. Trucks will then travel along site access roads adjacent to the BRC CAMU lined landfill area and enter into the BRC CAMU lined landfill area at dedicated access points or ramps. Upon entering the BRC CAMU lined landfill area, the trucks will travel directly on the operations layer above the liner system or above previously placed waste materials. Each truck will be directed to a "working face" where the contents of the truck will be dumped. Trucks will then travel off of the lined landfill area, across "rumble strips" and track-out aprons summarized in Section 3.17 and described in greater detail in the CAP. Water spray will be performed at dedicated decontamination areas as needed to minimize tracking waste materials off of the landfill. Trucks will exit the BRC CAMU Area at 4th Street.

Spillage of soils from trucks during transportation will be minimized by not overloading the transport vehicles, by grading smooth haul roads, and by employing trucks with enclosed or covered cargo bays. Dust will be controlled by water in accordance with the Dust Control and Mitigation Plan Application in Appendix C of the CAP. Because the access routes will be wetted to suppress dust, some mud will be

generated, and it is likely that this mud would be transferred to truck tires and the vehicle body. When needed, prior to crossing Boulder Highway, the transport trucks will be decontaminated by scraping and/or water spray to avoid transfer of dirt to the pavement. In addition, after excavation/transport operation cease for a given day, the affected portion of Boulder Highway will be cleaned to remove soils from the roadway.

In the event of an accident resulting in release of the soils being transported, the truck driver will immediately contact BRC. BRC will immediately inspect the site of the accident and notify the local emergency management agencies. The potential for immediate threat to workers and people nearby will be evaluated, and BRC will instruct the remediation contractor to take appropriate corrective steps to rectify the problem. Any spilled material will be returned to the truck (or another truck, if the original truck is disabled) and transport to the BRC CAMU will be complete. If the spill occurred on a public roadway (i.e., Boulder Highway), the spilled material will be removed, and the road surface will be immediately vacuumed to remove remaining materials.

4.3 Soil Placement

The waste material at the working face will be spread by a bulldozer in a lift no greater than 18-inches in thickness and compacted using standard earthworks construction equipment. The compaction of the waste material will be confirmed through monitoring of placement and through proof rolling of the waste. The moisture content will be compared to the optimum moisture content result from previously performed moisture/density laboratory testing. Ideally, the in-situ moisture content will be less than the optimum moisture content, thereby minimizing the potential for liquids to "squeeze out" of the waste material upon placement of overlying materials that will increase the normal static pressure and thus the "squeezing" of the underlying waste material.

5.0 REPORTING AND RECORDKEEPING

5.1 General

BRC will prepare daily progress reports documenting all daily activities. Daily activity records include, but are not limited to, documentation that evidences the quantity of waste materials placed in the BRC CAMU and log in/out forms. In addition to this summary daily report, the contractor will also keep detailed field notes and daily logs. Daily photographic and video record will be kept by BRC documenting all remediation activities. Records and results of daily, weekly, and monthly inspections will be maintained and kept onsite consistent with requirements specified in the AOC3.

Records and results of waste analysis and waste determinations will be maintained and kept on site. In addition, all monitoring, testing or analytical data, and corrective action records resulting from BRC CAMU releases shall be maintained onsite consistent with requirements specified in the AOC3. Groundwater monitoring and clean up records will be maintained until closure of the BRC CAMU.

Summary reports of all incidents that require the use of the Contingency Plan will contain the details outlined in Attachment G, Accident Prevention, Contingency, and Emergency Response Plan. The incident reports will be maintained and kept onsite until closure of the BRC CAMU.

Additional items to be included with the operating records are: closure and post-closure cost estimates, plans for closure and post-closure, EPA identification number, detailed chemical and physical analysis of a representative waste sample, Quality Control (QC) and Quality Assurance (QA) documentation.

5.2 Interim Status Reports

During remediation activities at the Site, BRC will submit monthly status reports to the NDEP as stated in the CAP. The purpose of the monthly status reports will be to keep the NDEP informed of the progress of remedial activities at the Site. The reports will present a summary of the remediation progress during the previous month, including as appropriate:

- Significant milestones in CAMU construction;
- Pond and ditch locations where excavation has been completed (including graphical format);
- Pond and ditch locations where special control measures (except dust control, which is routine measure) were necessary and/or where excavation had to be prematurely terminated due to the presence of ground water or based on any of the other “stopping rules” discussed in Figure J; and
- Estimates of volumes of soil excavated and placed in the CAMU (monthly and cumulative). Other information (e.g., discovery of significant environmental conditions previously unidentified) will be provided in the monthly status reports as warranted. Interim status meetings will also be conducted by telephone to supplement these written reports.

Other information (e.g., discovery of significant environmental conditions previously unidentified) will be provided in the monthly status reports as warranted or

otherwise required by the AOC3. Interim status meetings will also be conducted by telephone to supplement these written reports.

1.0 INTRODUCTION

This BRC CAMU Monitoring Plan describes the procedures and activities that BRC will undertake to detect and subsequently characterize releases of wastes or hazardous constituents to groundwater that may occur from areas of the BRC CAMU during operation and after closure.

2.0 CONSTRUCTION MONITORING

2.1 Surface water

BRC will carefully maintain drainage to expedite storm water collection. A portable pump will be provided at the low end of the BRC CAMU to remove accumulated storm water. The operator will maintain access to this pump and maintain the pump in good working condition with a good supply of fuel and suction hoses in position for water removal at all appropriate times.

During operating hours, the operator will pump water from the working cell as quickly as possible whenever it accumulates. When heavy rainfalls occur during non-operating hours, standing water will be pumped out before normal operations resume.

Surface water exiting the site from the on-site storm water basin will periodically be sampled and tested for general compliance with Nevada surface water standards for the Las Vegas Wash. BRC will obtain necessary NPDES permits from the NDEP prior to discharge of such waters.

2.2 Leachate

The BRC CAMU will be managed to reduce the generation of leachate. However, leachate, if generated, will slowly accumulate in the leachate collection sumps designed as part of the BRC CAMU. The base grade of the BRC CAMU will be engineered so that leachate generated will accumulate at the designated leachate collection points. The operator will monitor the leachate level and remove and dispose of the leachate, as needed, consistent with the Final Leachate Monitoring Plan (Attachment Z). During active waste placement, leachate collected from the sumps will be used for dust control and waste material moisture conditioning purposes over the lined areas only.

In addition, pan lysimeters, or vadose zone monitoring sumps, will be installed beneath the sump areas of the BRC CAMU to monitor for possible leakage from the liner system at the locations of the lowest elevations in the liner system (sumps),

which is where leachate, if any, will accumulate. The vadose zone monitoring sumps will be monitored in accordance with the Final Leachate Monitoring Plan (Attachment Z).

2.3 Air Monitoring

Given the small amount of additional waste to be placed in the Phase V of the CAMU, dust monitoring, similar to what was conducted during the bulk of the CAMU waste placement, is not cost-effective and will not be implemented. Based on prior air monitoring results, use of dust control measures should not create any off-site dust migration above relevant regulatory thresholds.

3.0 POST CLOSURE

3.1 General

Formal periodic inspections will be performed using site walks. These site walks will be performed within one week of significant precipitation events (e.g., greater than ¼ inch of rain during a 24-hour period) that could potentially impact either the surface water drainage system or the BRC CAMU cover. At a minimum, a site-wide inspection will be performed at least quarterly.

The condition of the facility will be documented with field notes, maps, and photographs, as appropriate. Evidence of potential compromises in the cover will be recorded including eroded patches, animal burrows, subsidence, and cracks along the cover. Surface water drainage features will be inspected for the presence of debris, physical integrity, and evidence of conditions that are different from design assumptions.

3.2 Final Cover

Final cover performance will be evaluated through a monitoring program of the final cover and periodic groundwater monitoring. The basis for this strategy is the fact that the final cover will be the critical element to reduce moisture infiltration into the BRC CAMU. Therefore, it is proposed that monitoring efforts be focused on direct observation, measurement, and analysis of the performance of the final cover.

The final cover system shall be periodically monitored in order to evaluate the performance of the final cover. The final cover monitoring plan consists of:

- visual inspection of the final cover system performed on a semi-annual basis and after all major precipitation events; and

- if erosion has occurred, ascertain damage to the geosynthetics, if any, and repair as necessary in accordance with the Technical Specifications and CQA Plan.

The decorative rock cover will be visually inspected for signs of erosion. Areas of erosion will be repaired as needed.

A solar field is planned for installation on top of the final cover. Additional discussion is provided in Section 3.0 of the application.

3.3 Leachate

The leachate collection system will be monitored in accordance with the Final Leachate Monitoring Plan (Attachment Z).

Because the proposed BRC CAMU is located in an arid environment receiving approximately 4.5 inches of average rainfall annually, with high rates of evaporation and low infiltration rates, it is unlikely that significant amounts of precipitation will be introduced to the BRC CAMU leachate collection and removal system. These factors will limit the generation of leachate. Moreover, the waste material consists primarily of soil, which will be monitored for moisture content prior to placement into the landfill.

Pan lysimeters, or vadose zone monitoring sumps, will be installed beneath the sumps to monitor leaks within the collection system. Pan lysimeters will be monitored at the same time as the leachate sumps in accordance with the Final Leachate Monitoring Plan (Attachment Z).

3.4 Settlement

A topography survey using 1-foot contour intervals will be performed within 3 months after final closure of the CAMU to document baseline conditions in support of post-closure settlement evaluations. Although settlement is not expected to be a significant issue, this will provide a convenient mechanism to document the surface elevation. Excessive settlement can lead to depressions and ponding causing stress in the infiltration layer. When depressions are identified through the survey, they will immediately be filled with the appropriate cover material.

3.5 Groundwater

The groundwater at the site ranges from 30 to 60 feet bgs, as discussed in the Draft CAMU Area Conceptual Site Model (DBS&A, 2006). At a minimum, the BRC

CAMU base liner is approximately 5 feet above the groundwater. Constituent release to the groundwater from the BRC CAMU, post-closure, is considered unlikely for the following reasons:

- The BRC CAMU will not receive liquid waste or waste containing free liquids;
- Waste materials within the BRC CAMU are relatively immobile;
- The BRC CAMU will be designed and operated to reduce liquid, precipitation, and other run-on and run-off; and
- The BRC CAMU will have both a base liner system, with a leachate collection and removal system, and final cover system.

It should be noted that releases, if any, into the upper aquifer are difficult to monitor because of the impaired quality of the existing groundwater beneath the BRC CAMU. Most or all of the same constituents which will be present in the BRC CAMU are currently present in groundwater at the site. Constituents present in upgradient groundwater make differentiating potential releases from the BRC CAMU difficult or impossible. BRC has completed a set of four semi-annual baseline groundwater monitoring events. Based on this monitoring, a long term groundwater monitoring plan is in development. When approved, BRC will conduct long term groundwater monitoring in accordance with this plan. (see Attachment Y).

4.0 REPORTING AND RECORDKEEPING

Monitoring results will be maintained by BRC in accordance with the provisions of the AOC3 following closure of the CAMU. Monitoring results will be summarized and submitted to NDEP with the annual post-closure report of inspection and monitoring activities.

1.0 INTRODUCTION

This section of the permit application addresses the closure of the BRC CAMU, which will occur when disposal operations are complete. This Closure Plan addresses pertinent regulatory requirements, including a description of the final cover. It is anticipated that a final CAMU Closure Plan will be prepared approximately six months prior to closure. By that time, additional details regarding BRC CAMU volume will be available. For purposes of this permit application, the Closure Plan addresses activities that will occur when waste placement activities are complete.

Access to the BRC CAMU will be controlled during the closure phase using procedures employed during the operational phase (see Security Plan, Attachment D). Fugitive dust control measures will be maintained and traffic management procedures continued. Site aesthetics will continue to be an important element during this phase. Community outreach programs will be continued as part of the overall remediation effort (as discussed in the Community Involvement Plan) to address public concerns and issues associated with the BRC CAMU.

1.1 Notice of Intent to Close

At least 60 days before beginning the closure of the BRC CAMU, the NDEP will be notified in writing of the intent to close. BRC CAMU closure activities will begin no later than 30 days after the date on which the final receipt of wastes occurs.

All closure activities will be completed in accordance with this CAMU Closure Plan within 180 days after the beginning of the closure. An extension beyond this 180-day deadline may be requested if it is determined that additional time is needed and all actions are taken necessary to prevent threats to public health and safety and the environment.

A request for an extension to these deadlines will include a description of the measures needed to control access to the unclosed unit prior to closure or receipt of additional wastes. It would also include a description of activities to prevent threats to public health and safety and the environment from the open unit.

1.2 Construction Schedule and Sequence

1.2.1 Final Waste Placement

After receipt of the final waste, either construction of the final cover will begin or an interim cover will be placed. If the unit is going to be left without the final

cover for longer than 30 days, the interim cover layer will be placed and compacted on top of the final waste layer.

1.2.2 Infiltration Layer Construction

The infiltration layer will be placed beginning with the geosynthetic clay liner (GCL) above the interim cover. The geomembrane is placed above the GCL with the geocomposite placed last. Details of each layer are discussed in later sections.

1.2.3 Final Cover Construction

The soil materials for the final cover will be placed, compacted, and graded. The permanent storm drain facilities (gutters, ditches, culverts, headwalls, etc.) will be installed as the cover is being completed.

2.0 FINAL COVER COMPONENTS

The final cover is designed to minimize infiltration and erosion. A final cover that reduces infiltration is an essential component in the overall design strategy for the BRC CAMU. This, combined with adequate moisture control of the wastes prior to placement, should ensure that no leachate is formed.

Specific design objectives of the final cover system include:

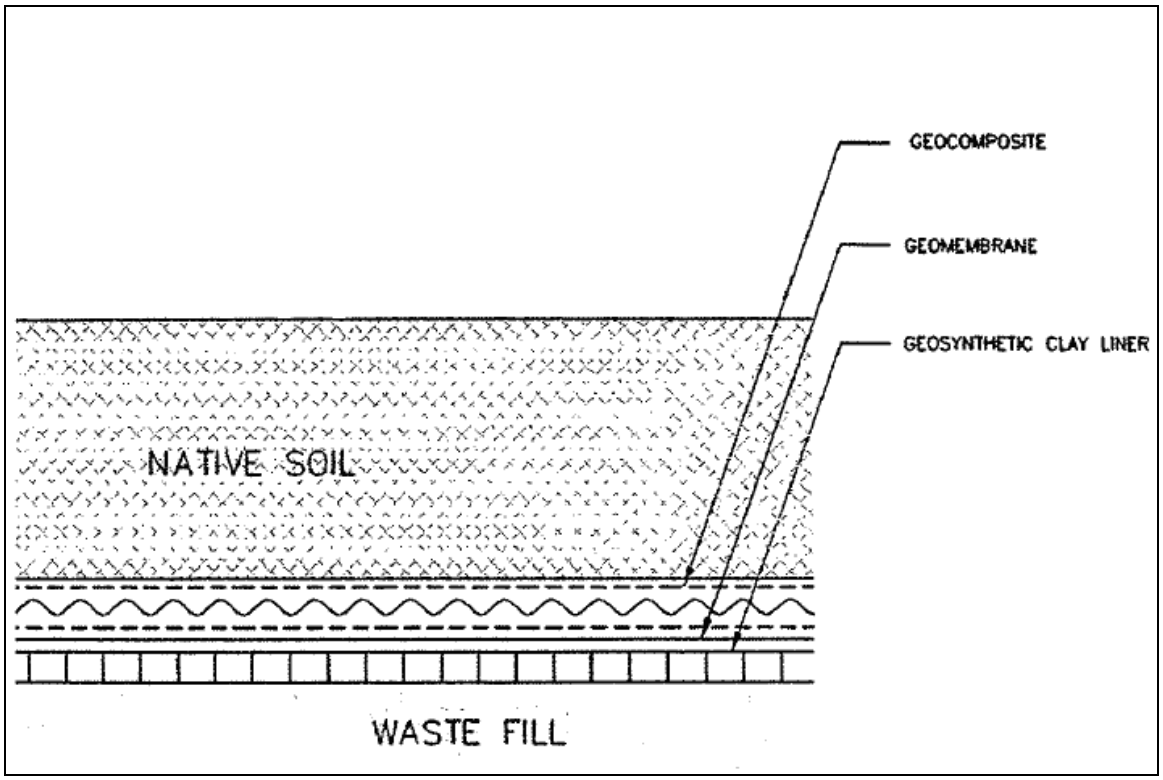
- Minimize infiltration of precipitation into the waste;
- Promote good surface drainage;
- Resist erosion by rain and wind;
- Protect human health and the environment;
- Improve aesthetics;
- Reduce long-term maintenance; and
- Be consistent with land use.

Several of these objectives are directly related to regulatory requirements while the others represent design considerations. BRC CAMU closure technology, design, and maintenance procedures continue to evolve, and it is possible that the cover design for the BRC CAMU may be refined prior to final closure to incorporate the latest design procedures. Modifications or enhancements to this proposed design would be submitted to the NDEP for approval prior to implementation.

Infiltration through the final cover will be minimized through:

- Design of adequate surface drainage and runoff with minimal erosion; and
- Design of composite barrier system (HDPE geomembrane over GCL) with an overlying drainage layer (geocomposite) to minimize hydrostatic head build-up on the geomembrane.

The final cover will consist of a separate infiltration and erosion layer. Engineering design calculations and construction specifications for the final cover system are presented within Sections 5, 6, and 7 of the Supplemental RAP Information (SRAPI). A cross section of the Final Cover System is shown in Detail O-1 below with an explanation of the components explained in the following sections.



Detail O- 1, Final Cover System

2.1 Infiltration Layer

40 CFR 264.310 specifies that the final cover be designed and constructed to have a permeability less than or equal to the permeability of any bottom liner system. Based on the proposed base liner system, construction of this type of cover will involve the use of a geomembrane and GCL composite liner system to serve as the infiltration layer as shown in Detail O-1 above.

The cover system will be designed to be physically stable to reduce failure, such as sliding between cover layers or within the waste.

Settlement is not expected to be a significant issue given the nature of the waste material and the manner of its placement (i.e. well compacted). Excessive settlement and subsidence at MSW landfills, caused by decomposition and consolidation of the wastes, can impair the integrity of the final cover system. Specifically, it can contribute to ponding of surface water on the cover and fracturing of the low-permeability layers of the cover. However, because the source materials for this BRC CAMU consist primarily of soil materials, the waste placement will be fairly homogeneous with little potential for significant differential settlement. Moreover, the soils will be compacted after placement.

The methods, procedures, and processes used to install the final cover system will be consistent with standard industry practices. Detailed design documents and construction specifications are included in Section 7 of the SRAPI. Included in the CQA plan is a description of quality control testing procedures for the construction materials and associated quality assurance procedures for construction activities. An independent registered professional engineer will be hired to observe closure activities and provide necessary certifications.

2.2 Protection Layer

Protection of the infiltration layer will be accomplished by the use of a 22-inch thick layer consisting of earthen material with 2-inch decorative rock layer. The source for erosion layer soils will be native, clean soil. It is expected to be from the vicinity of the BRC CAMU or from elsewhere in the BMI Common Areas. The earthen material used for the erosion layer will be free of debris, cobbles, rubbish, and roots. If the CAMU materials are used, then they will not be exposed to the atmosphere and will be covered with additional clean materials procured from outside the CAMU area.

The erosion layer will be designed to be geotechnically stable to reduce failure, such as sloughing of the soils overlying the geomembrane/GCL composite infiltration layer (Section 2, Calculation Package I in the SRAPI).

The surface of the erosion layer will have a minimum slope of 2 percent to facilitate run-off while reducing erosion. The side slopes will have a 3H:1V (Horizontal:Vertical) slope. The final grading plan is shown on Figure J-9 in the SRAPI.

2.3 Surface Water Drainage System

A surface water drainage system, designed by ATKINS, will be constructed to convey runoff around and away from waste disposal areas. Surface water will be conveyed around the BRC CAMU to two retention basins located at the northeast and northwest corners of the site. The water will be conveyed by concrete channels and pipes as shown on Figure J-8. The channel and pipe locations correspond to the locations of the access roads for the BRC CAMU. Surface water from the top deck will be conveyed to the conveyance channels via two rip-rap lined channels in the northeast and northwest corners. Drainage channels are designed along existing natural features to enhance surface runoff during high-precipitation events. Based on a 25-year storm event, the design will be sufficient to control erosion and maintain the stability of the slope (ATKINS, 2006).

2.4 Performance Evaluation of the Final Cover

The design of the final cover was evaluated using the Hydrologic Evaluation of Landfill Performance (HELP) model, which was developed by the U.S. Army Corps of Engineers for the USEPA and is widely used for evaluating the hydraulic performance of landfill cover systems (USEPA, 1993). The HELP model calculates daily, average, and worst-case estimates of water movement across, into, through, and out of landfills. The input parameters for the model include soil properties, precipitation and other climatological data, vegetation type, and landfill design information. Useful information provided by the HELP model includes surface run-off, duration, and quantity of water storage within the erosion layer, and net infiltration through the cover system. The information is used for performance evaluation of the geocomposite and drainage pipe sizing, as described in Section 3.4 below.

Site-specific input parameters were used in the HELP model and are documented in Section 5, Calculation Package A in the SRAPI. The results indicated that the net infiltration through the cover system would be 0.000002 in/year.

3.0 SUMMARY OF COVER ANALYSIS

3.1 General

This section summarizes the results of design analyses that were performed for the final cover at the BRC CAMU Landfill site. The following calculations were performed and are located in the respective Calculation Package found in Section 5 unless otherwise noted of the SRAPI:

- Slope Stability Evaluation - Final Waste Slopes (Section 2, Calculation Package B);
- Comparison of Flow between a compacted clay liner (CCL) and geosynthetic clay liner (GCL) (Section 2, Calculation Package I);
- Drainage Geocomposite and Pipe Size Calculations (Calculation Package A);
- Veneer Stability Calculations (Calculation Package B);
- Cover Soil Sloughing Stability Calculations (Calculation Package C);
- Geotextile Filtration Calculations (Calculation Package D);
- Geotextile Puncture Protection Calculations(Calculation Package E);
- Pipe Strength Calculations (Calculation Package F); and
- Seismic Performance Evaluation (Calculation Package G).

The final cover system calculations are based on the conceptual design grading plans shown on Figure J-9 in Section 1 of the SRAPI. Additional calculations and/or design modifications may have to be performed if there are changes to elevation and grade in the aforementioned design grading plans. Design modifications are described in the Closure CQA Reports.

3.2 Slope Stability Evaluation - Final Waste Slopes

Geosyntec analyzed the stability of the final waste slopes for the BRC CAMU as discussed in Attachment J. The slope stability analysis is included in Section 2, Calculation Package B of the SRAPI.

3.3 Comparison of Flow between a CCL and GCL

Geosyntec demonstrated that the flow rate through the prescriptive composite liner system (i.e. - CCL) is greater than the flow rate through the alternative composite liner system (i.e. - GCL), as discussed in Attachment J. The comparison of flow between a CCL and GCL is presented in the SRAPI, Section 2, Calculation Package I.

3.4 Geocomposite and Pipe Size Calculations

A geocomposite will be placed above the geomembrane to collect and drain surface water that has infiltrated through the cover soil. Drainage pipes will be placed in the final cover to collect water from the geocomposite and drain the water to the perimeter surface water collection channels. Analyses were performed to model infiltration using U.S. Environmental Protection Agency's (USEPA) Hydrologic Evaluation of Landfill Performance (HELP) model.

The head on the cover liner was evaluated to be less than 12-in. at the top deck area, and negligible (i.e., less than 1/10-inch) on the side slopes. Furthermore, the

calculations suggest that a 4-in diameter perforated corrugated polyethylene (CPE) pipe bedded in drainage aggregate will accommodate the maximum flow predicted by HELP model analyses. The 4-in. diameter perforated CPE pipe shall have a smooth interior wall to maximize pipe efficiency. Geocomposite and drainage pipe size calculations are presented in the SRAPI, Section 5, Calculation Package A.

3.5 Veneer Stability

The design criteria for the side slope liner system is to develop zero tension in the geosynthetics during installation of the final cover on the side slopes. Potential causes of tension in the liner system include construction equipment loading and overburden stresses (e.g., final cover materials). Based on the proposed grades and expected construction conditions, the calculations suggest that the side slope liner system will not be placed into tension provided a minimum interface friction angle of 20 degrees is maintained. Veneer stability calculations are presented in the SRAPI, Section 5, Calculation Package B.

3.6 Cover Liner Sloughing Stability

Based on the geocomposite and pipe size calculation results, no head buildup is expected above the side slope final cover system geosynthetic components. Calculations suggest that the minimum cover soil shear strength (interface with geocomposite or internal) of 27 degrees will meet the design factor of safety criteria of 1.5. the yield acceleration was found to be 0.15g ($g = 32.2\ ft/s^2$). Cover liner sloughing calculations are presented in the SRAPI, Section 5, Calculation Package C.

3.7 Geotextile Filtration Requirements

A separation/filtration geotextile will be used in the following applications: (i) a component of the geocomposite for the final cover system, and (ii) separation/filtration between the cover soil and drainage aggregate. The purpose of the separation/filtration geotextile is to limit migration of fine material from the cover soil into the geocomposite and drainage aggregate, thereby reducing the transmissivity and hydraulic conductivity of the respective materials. The calculations suggest that the separation/filtration geotextile have an apparent opening size (AOS) greater than sieve No. 70, a permittivity greater than $0.5\ sec^{-1}$, and sufficient mechanical strength properties. Geotextile separation/filtration calculations are presented in the SRAPI, Section 5, Calculation Package D.

3.8 Geotextile Puncture Protection

The geocomposite and geosynthetic clay liner (GCL) will protect the geomembrane from puncture by particles from the prepared subgrade and cover soil. The geotextile components of the drainage geocomposite will protect the geomembrane from puncture by oversized particles in the cover soil. The geotextile components of the GCL will protect the geomembrane from puncture by particles from the prepared subgrade. For the design loading condition, Geosyntec conservatively assumed an H-20 haul truck tire loading which exhibits a very high force related to hauling equipment. The analysis suggests that the following maximum particle sizes and geotextile mass per unit areas will be required:

Soil Component of Liner	Maximum Particle Size	Minimum Mass per Unit Area
Prepared Subgrade	1.5-in.	9 oz./yd^2 (GCL)
Cover Soil	1-in.	6 oz./yd^2 (single-sided geocomposite)

Table O-1, Geotextile Puncture Protection

Geotextile puncture protection calculations are presented in the SRAPI, Section 5, Calculation Package E.

3.9 Pipe Strength Calculations

Based on drainage pipe size analyses, a 4-in. diameter perforated CPE pipe will be used to collect and transport surface water that has infiltrated through the final cover soil into the geocomposite on the top deck area of the landfill. Based on the calculations performed for the 4-in. diameter perforated CPE pipe, the pipe has adequate strength to withstand equipment (i.e., H-20 haul truck) and soil overburden loads. Pipe strength calculations are presented in the SRAPI, Section 5, Calculation Package F.

3.10 Seismic Performance Evaluation

3.10.1 General

Geosyntec performed an evaluation of the seismic performance of the BRC CAMU. The evaluation included a seismic hazard evaluation, site response analyses, development of site-specific deformation charts, and seismic deformation analyses for the final cover and base liner of the proposed BRC CAMU.

3.10.2 Seismic Hazard Evaluation

Geosyntec evaluated the seismic hazard at the site using the most recent United States Geological Survey (USGS) probabilistic seismic hazard maps (Frankel et al., 1996). For compliance with the State of Nevada regulations, Geosyntec considered motions with 2 percent probability of being exceeded in 50 years for use in design. The

USGS data was used to establish the design free-field peak horizontal ground acceleration (PHGA) and set limits on the target acceleration response spectrum for design ground motions. The 2 percent probability of exceedence in 50 years USGS map values indicate that the free-field bedrock PHGA at the site equals 0.34 g from USGS. Based on the deaggregated hazard for Las Vegas, this PHGA was assigned a representative moment magnitude (M_w) of 6.5. The seismic hazard evaluation is presented in the SRAPI, Section 5, Calculation Package G.

3.10.3 Evaluation of Design Ground Motions

A suite of acceleration time histories considered representative of the 2 percent in 50 year ground motions evaluated in the seismic hazard analysis was selected for use in the seismic response analyses. Geosyntec selected a suite of three time histories that enveloped the target response spectrum using the following methodology: (i) screen the database of acceleration time histories on the basis of earthquake magnitude to select a reduced set of accelerograms; and (ii) plot the acceleration response spectra of the candidate accelerograms against the target acceleration response spectrum and select the representative accelerograms for use in design analyses. Using the above methodology, Geosyntec selected three candidate accelerograms to represent design ground motions at the BRC CAMU site: (i) the Parkfield earthquake, M_w 6.3, (ii) the Superstition Mountain earthquake, M_w 6.5, and (iii) the Big Bear Lake earthquake, M_w 6.7. Evaluation of the design seismic ground motions are presented in the SRAPI, Section 5, Calculation Package G-1.

3.10.4 Site Response Analyses

One-dimensional site response analyses were performed for the BRC CAMU using the computer program SHAKE91 (Idriss et al., 1992). Analyses were performed for two conditions; (i) 30-ft of contaminated soil placed on the ground surface (i.e., the North Mesa), and (ii) 60-ft of contaminated soil placed 30-ft below grade (i.e., the South Mesa). Shear wave velocity and layer thickness data for the native soil was derived from spectral-analysis of surface waves (SASW) testing performed at the site by Dr. Barbara Luke at the University of Nevada at Las Vegas. Since the depth to bedrock is not known, the thickness to bedrock was varied to evaluate the effect of depth to bedrock on the results of the analysis. The calculated accelerations are all less than 0.50 g and generally decrease with increasing depth to bedrock. Site response analyses results are presented in the SRAPI, Section 5, Calculation Package G-2.

3.10.5 Site-Specific Seismic Deformation Charts

The site-specific deformation charts were developed using the computer program YSLIP_PM (Yan et al., 1996). YSLIP_PM is based upon the Newmark

(Newmark, 1965) method for seismic deformation analysis. YSLIP_PM uses the yield acceleration of the slope (e.g., liner system or final cover system) and the output of the seismic site response analysis to compute seismic deformations. The results indicate that the largest seismic displacement response is calculated by applying the Parkfield earthquake record. The site-specific seismic deformation charts are presented in the SRAPI, Section 5, Calculation Package G-3.

3.10.6 Deformation Analyses

Geosyntec evaluated the expected seismically-induced permanent deformations at the BRC CAMU. The calculations suggest that the calculated seismically-induced permanent deformations are less than 3-in. for the final cover and less than 6-in. for the base liner. These deformations are less than current generally accepted limits for the final cover and for the base liner. Therefore, the seismic performance of the waste containment system proposed for the BRC CAMU is considered to meet current design standards. The site-specific seismic deformation calculations are presented in the SRAPI, Section 5, Calculation Package G-4.

4.0 COVER CONSTRUCTION REQUIREMENTS

4.1 General

This section describes the construction requirements for installation of the final cover system at the BRC CAMU. These construction requirements are necessary in order to ensure that the construction of the final cover system is consistent with the design performance goals and assumptions.

Technical Specifications and a Construction Quality Assurance (CQA) plan have been prepared for the construction of the final cover system that incorporates the construction requirements presented in this section. Geosyntec's proposed CQA Plan and Technical Specifications related to the final cover system are presented in the SRAPI, Section 6 and 7, respectively.

4.2 Slope Stability Evaluation

Final cover and interim waste soil slopes shall be constructed no steeper than a slope inclination of 3:1 (horizontal:vertical).

4.3 Geocomposite Requirements

A geocomposite will be used to collect infiltration of surface water through the cover soil. The geocomposite shall have the following properties:

- transmissivity no less than 5 x 10^{-4} m^2/sec under a confining pressure of 2,000 psf and a hydraulic gradient of 0.10.
- an 6 oz/yd^2 nonwoven geotextile bonded to each side of the geonet for the side slopes (i.e., double-sided) and one 6 oz/yd^2 nonwoven geotextile bonded to the top side of the geonet for the top deck (i.e., single-sided); and
- the 6 oz/yd^2 nonwoven geotextile shall have sufficient permittivity and mechanical properties as summarized in Section 3.7.

4.4 Drainage Pipe Requirements

The drainage pipes used to collect water from the geocomposite shall be 4-in. diameter perforated CPE pipe with a smooth interior wall. The drainage pipes shall be backfilled with aggregate. The aggregate shall have a maximum particle size of 1-inch and a minimum hydraulic conductivity of 1 x 10^{-2} cm/sec.

4.5 Final Cover Soil

The cover soil shall be placed from the bottom-up, using equipment exerting a ground pressure no greater than 10 psi. Cover soil shall be compacted to minimum of 90 percent of the maximum dry density determined by ASTM D 1557 and the lower 12-inches will have a maximum particle size of 1-in. diameter. Surface water control and drainage shall be promoted.

4.6 Equipment Loadings

Equipment loads shall be limited to a maximum loading of 10 psi overlying a minimum of 1 ft of cover soil. In addition, roads for haul trucks shall be a minimum of 2 ft in thickness overlying the final cover system geosynthetic components.

4.7 Geotextile Requirements

A geocomposite consisting of either one or two geotextile components of the final cover liner system is proposed. The geotextiles will serve a dual purpose - separation/filtration and cushion protection. The geotextile shall have the following properties:

Matrix	Nonwoven
Mass per Unit Area	6 oz/yd^2
Apparent Opening	≤ Sieve No. 70
Permittivity	≥ 0.5 sec-1
Grab Strength	≥ 130 lb
Puncture Strength	≥ 40 lb
Mullen Burst	≥ 210 psi
Trapezoidal Tear	≥ 40 lb
Ultraviolet strength retention	≥ 70%

4.8 Geosynthetic Clay Liner (GCL)

The GCL component of the final cover system shall have the following properties:

- Index flux not greater than 1 x 10^{-8} m^3/m^2-sec;
- Minimum interface/internal shear strength of 20 degrees;
- The GCL shall be dry during installation; and
- combined geotextile mass per unit area of 9 oz./yd^2.

4.9 Geomembrane Requirements

The geomembrane shall be HDPE and have a nominal thickness of 60-mil. The geomembrane shall be double-sided textured on the side slopes and may be smooth on the top deck.

4.10 Prepared Subgrade Requirements

The prepared subgrade shall have a maximum exposed particle diameter less than 1.5-inch.

4.11 Final Cover Surface Treatment

The final cover will require surface treatment to reduce surface erosion due to rainfall or wind forces. There are a wide variety of possible surface treatments to reduce erosion. For example, cobbles or rip rap can be placed on the outer slope surfaces, aggregate base or crusher-run rock can be applied to flatter surfaces such as the top deck or roadways, and some areas can be treated chemically to bind the soil together. Side slopes typically require a different treatment than the top deck or roadways. The final selection of materials and treatment will be performed prior to commencing closure activities and will be consistent with the NDEP's guidelines for erosion mitigation.

5.0 CAMU POST-CLOSURE PLAN

This section of the permit application addresses post-closure activities for the BRC CAMU, which commence after final closure is completed and extends for a period of 30 years therefrom. This preliminary Post-Closure Plan provides a description of procedures that will be used to maintain the integrity of the final cover system. It is anticipated that the Post-Closure Plan will be updated prior to completing closure activities.

5.1 Requirements After Closure

After closure of the BRC CAMU, a notation on the landfill property deed, or any other instrument that is normally examined during a title search, will be recorded in Clark County. The notation on the deed, or other instrument, will in perpetuity notify any potential purchaser of the property that the land has been used as a landfill and that its use is restricted to uses that would not negatively affect the integrity of the landfill.

Permission may be requested in the future from Clark County to remove the notation from the deed, or other instrument, if all wastes are removed from the site. Any request would document that all wastes have been removed from the facility. Such documentation might include photographs, soil testing in the area where the wastes were deposited, and reports of waste removal activity.

5.2 Program for Postclosure

After closure of the BRC CAMU, a program for post-closure will be conducted as stipulated by the AOC3. This post-closure program will ensure that the integrity and effectiveness of the final cover will be maintained, including making repairs to the cover as necessary to correct the effects of settlement, subsidence, erosion or other events.

Following closure of the CAMU, certification will be submitted to the NDEP verifying closure. This will be signed by an independent Nevada registered professional engineer and will verify that the program was completed in accordance with the CAMU Closure Plan. The certification will be placed in the operating record. The certification will be based on knowledge of the Closure Plan, observations made during closure, and documentation of closure activities.

Post-closure use of the property will be managed to not disturb the integrity of the final cover, liner or other components of the BRC CAMU (e.g., surface water drainage network, infiltration monitoring system, etc.).

5.3 Land Use

The post-closure use of the BRC CAMU site is to install a solar field on top of the final cover, substantially covering the CAMU with the remainder maintained as open space containing a variety of native vegetation. Access to the site will continue to be restricted. Any solar field installed will be designed to be compatible with the design of the final cover. For additional discussion, please see Section 3.0 of the application. The final cover will not be compromised due to incompatible development. It is anticipated that this land use will be maintained beyond the 30-year required post-closure monitoring duration. However, no land use will be allowed that would compromise the integrity of the final cover system, the liner system, or other components of the containment or monitoring systems.

A precise, metes-and-bounds survey of the closed BRC CAMU will be conducted and the resulting map recorded with the clerk of Clark County. The recordation will include a notation that the property is a Corrective Action Management Unit and contains remediation waste.

5.4 Personnel

Post-closure care personnel will have received adequate training in their specific job duties. This includes applicable OSHA health-and-safety training as well as pertinent training in BRC CAMU maintenance procedures. This staff will consist of a facility manager and various staff workers as needed. The name, address, and telephone number of the facility manager will be provided to the NDEP during the closure process.

Specific duties of these staff will include:

- Limiting access to the site and providing security;
- Performance of routine operations and maintenance activities;
- Responding to public or community inquiries;
- Ensuring regulatory compliance and maintaining appropriate documentation;
- Managing and coordinating post-closure monitoring (i.e., the leachate collection system); and
- Maintenance of the vegetative cover, if necessary.

5.5 Security

The perimeter fencing will remain after closure of the BRC CAMU. Security personnel will not be required 24-hrs because the waste will not be exposed nor will access by the public or domestic livestock pose a health hazard. The perimeter fence will

be maintained to deter trespassing. The periodic site inspection walks to assess the cover system will include an evaluation of the perimeter fence.

5.6 Operation and Maintenance

Routine maintenance will be required to maintain the effectiveness of the various BRC CAMU sub-systems. This will include periodic maintenance, and repairs of the final cover, the surface water drainage system, the leachate collection system, and the vegetative cover.

Routine operations and maintenance activities will include frequent inspections of the BRC CAMU. Particular attention will be given to any conditions that could compromise the integrity of the final cover or the associated surface water drainage system or the soil moisture monitoring system. Normal erosion processes are expected to result in the need to periodically replace some cover material and to fill depressions caused by settlement. Extensive maintenance of the vegetative layer is not anticipated since it is being designed to be tolerant of the low rainfall and large temperature extremes in Las Vegas. Occasional fertilizing, if vegetated, may be needed, especially during the first few years after closure. Maintenance of the solar field to be installed on top of the final cover will be in accordance with the land lease between BRC and the third-party solar contractor, which will ensure proper protection of the cover.

5.7 Post-Closure Inspections and Monitoring

Post-closure monitoring will be performed as outlined in Attachment N, Landfill (CAMU) Monitoring Plan. In summary, the final cover, leachate, settlement, and groundwater monitoring will be performed, as needed, for a period of 30 years after closure of the BRC CAMU. Formal periodic inspections will be performed using site walks. These site walks will be performed within one week of significant precipitation events (e.g., greater than ¼ inch of rain during a 24-hour period) that could potentially impact either the surface water drainage system or the BRC CAMU cover. At a minimum, a site-wide inspection will be performed at least bi-annually.

At least annually, an internal audit will be performed to verify that all activities at the site have been performed in accordance with the provisions of this Post-Closure Plan. Inspection records will kept and maintained in a log book in order to clearly document any changes in physical conditions. Copies of the inspection report will be provided to the NDEP annually. Post-closure inspections will occur for at least 30 years after BRC CAMU closure.

Reports and Recordkeeping

The condition of the facility will be documented with field notes, maps, and photographs, as appropriate. Evidence of potential compromises in the cover will be recorded including eroded patches, patches of dead vegetation, extensive or significant animal burrows, subsidence, and cracks along the cover. Surface water drainage features will be inspected for the presence of debris, physical integrity, and evidence of conditions that exceeded design assumptions.

A copy of the plans for closure and post-closure will be maintained in the operating records of the site.

Table of Contents

1.0 ..... Introduction Q-1
2.0 ..... Closure costs Q-1
3.0 ..... Post-Closure Costs Q-1

1.0 INTRODUCTION

The estimated and projected cost to close and post close the BRC CAMU is explained in this Attachment. These cost estimates summarized herein are for budgeting and planning purposes only.

The current closure and post closure cost estimates will remain on site during the operating life of the BRC CAMU.

2.0 CLOSURE COSTS

At this time, all Phases of the CAMU except for Phase V have been closed. Thus, no additional Closure costs are relevant for these prior Phases. In addition, BRC anticipates closing Phase V roughly by the end of 2014 and all anticipated Closure costs for Phase V are already budgeted for 2014. While it is not clear when the renewed RAP will be issued, it is likely to be within months of closure of Phase V. Therefore, BRC does not believe that any additional demonstration of Closure costs is relevant for this renewal. In other words, there is no financial risk that BRC will be unable to closure this last Phase V, when it has already demonstrated that it can close and has closed the previous Phases of the CAMU. Thus, BRC is not providing a separate Closure cost for this last Phase. BRC will of course, as a matter of ongoing project management, keep NDEP appraised as to all closure activities related to Phase V so that NDEP is aware of all such activities.

3.0 POST-CLOSURE COSTS

The post-closure cost estimate is based on the 30-year cost of annual inspection, monitoring, and maintenance at the BRC CAMU, including implementation of the NDEP-approved annual groundwater monitoring program, sump dewatering, off-site disposal of leachate, expected maintenance due to weather-related impacts to the CAMU cover, weed management and control, etc. Making reasonable assumptions for these costs, based on costs that have been incurred in the last several years for such activities, BRC expects that the 30-year post-closure cost will be roughly $3,323,000. Of course, BRC will update this estimate for the next RAP renewal after 5 years.

It should be noted that BRC has not included in this post-closure estimate, any additional NDEP management or regulatory fees. BRC is aware that NDEP is likely to propose regulations covering such fees. However, at this point in time, such developments are preliminary and there is therefore no firm basis to include NDEP management costs. Should this change, BRC will update this cost estimate accordingly.

Estimate of Geosyntec Post-Closure Costs
BRC CAMU
Henderson, Nevada

Geosyntec consultants

Item No.	Item	Unit	Unit Price	No. Units	Total	Comments
1	**Annual Groundwater Monitoring**	**YR**	**$ 80,000.00**	**1**	**$ 80,000.00**	
1A	*Field Collection and Analysis*	*LS*	*$ 45,000.00*	*1*	*$ 45,000.00*	Assume $15K for field collection; $30k for analysis

3A	*Inspections*	*LS*	*$ 5,000.00*	*1*	*$ 5,000.00*	4 inspections/yr, 8 hrs each; PM 6 hr/yr
3B	*Repairs*	*LS*	*$ 20,000.00*	*1*	*$ 20,000.00*	$20K, lump sum

***If off-site disposal of LCRS leachate is required, cost per gallon for Non-Haz transportation & disposal will be $0.85 per gallon**

Attachment R
Financial Assurance

Attachment R
Financial Assurance
Basic Remediation Company (BRC)
Corrective Action Management Unit (CAMU)
Henderson, Nevada

The mechanism for financial assurance for the entire cleanup project, which includes post-closure costs associated with the CAMU itself, is the attached CAMU bond #1099778.

Attachment S
Sudden and Non-sudden Insurance Documentation

Attachment S
Sudden and Non-sudden Insurance Documentation
Basic Remediation Company (BRC)
Corrective Action Management Unit (CAMU)
Henderson, Nevada

Provisions for insurance including sudden and non-sudden insurance coverage for the entire cleanup project are provided in the attached declarations for insurance policy #7983-43-09.

To the extent the attached policy does not provide insurance coverage for sudden and non-sudden accidental occurrences, BRC maintains additional policies which cover sudden and non-sudden accidental occurrences for the entire cleanup project. These policies substantively conform with the requirements contained in the CFR. BRC warrants that, as contained and defined in the policies, the "landfill areas" include the CAMU. BRC further warrants that its remaining allocated coverage limits meet the required amounts set forth in the CFR ($3,000,000/$6,000,000). BRC further warrants that the policies will be in place prior to final closure of the CAMU or so long as leachate tanks are located at the CAMU.

If, at any time while this Permit is active and prior to final closure of the CAMU, the amount of BRC's coverage limits dip below the required amounts, or if BRC learns of any information which would adversely affect these policies coverage of sudden and non-sudden accidental occurrences with respect to this Permit, BRC will inform NDEP and provide alternative coverage immediately.

1.0 INTRODUCTION

Records of all data, drawings and calculations concerning work proposed or completed at the BRC CAMU will be kept on permanent file in the BRC Data Repository, consistent with document retention requirements specified in the AOC3. In addition, records will be maintained at the BRC offices in conjunction with investigative work at the BRC CAMU. Included in the reports will be appendices with copies of data sheets, log books, and laboratory analysis results. All investigative results will be incorporated into the reports detailed in the following section.

Prior to any document destruction, NDEP will be provided an opportunity to acquire the documents in question.

2.0 OPERATIONAL RECORDKEEPING AND REPORTS

2.1 Training Records

BRC will maintain records of training received by onsite workers. These records will include copies of certificates received prior to BRC CAMU site activities and site specific training received. The training records will be stored onsite at the facilities maintained by BRC. Records will be maintained onsite for a period consistent with that specified in the AOC3.

2.2 Operational Records

The contractor will prepare daily progress reports documenting daily BRC CAMU activities. Daily activity records include, but are not limited to, documentation that evidences the quantity of waste materials placed in the BRC CAMU and log in/out forms. In addition to this summary daily report, the contractor will also keep detailed field notes and daily logs documenting:

- the date, project name, location, and other identification;
- a summary of the weather conditions;
- a summary of locations where construction is occurring;
- equipment and personnel on the project; and
- a summary of meetings held and attendees.

Daily photographic and video record will be kept by BRC documenting disposal activities. Records and results of inspections will be maintained and kept onsite for a period consistent with the AOC3.

Records and results of waste analysis and waste determinations will be maintained and kept on site. In addition, monitoring, testing or analytical data, and corrective action records resulting from BRC CAMU releases shall be maintained for three years. Groundwater monitoring and clean up records will be maintained until closure of the BRC CAMU.

Summary reports of all incidents that require the use of the Contingency Plan will contain the details outlined in Attachment G, Accident Prevention, Contingency, and Emergency Response Plan. The incident reports will be maintained and kept onsite until completion of the post-closure period for the BRC CAMU.

Additional items to be included with the operating records are: closure and post-closure cost estimates, plans for closure and post-closure, EPA identification number, detailed chemical and physical analysis of a representative waste sample, Quality Control (QC) and Quality Assurance (QA) documentation.

2.2.1 Construction Quality Control and Quality Assurance

The CQA Site Manager will prepare daily reports that document the activities observed during each day of activity as detailed in the CQA Plans for the Base Liner and Final Cover Systems (Sections 3 and 6 in the SRAPI, respectively). The daily reports may include monitoring logs and testing data sheets. At a minimum, these logs and data sheets will include the following information:

- a description of materials used and references of results of testing and documentation;
- identification of deficient work and materials;
- results of re-testing corrected “deficient work;”
- an identifying sheet number for cross referencing and document control;
- descriptions and locations of construction inspected;
- type of construction and inspection performed;
- description of construction procedures and procedures used to evaluate construction;
- a summary of test data and results;
- calibrations or re-calibrations of test equipment and actions taken as a result of re-calibration;
- decisions made regarding acceptance of units of work and/or corrective actions to be taken in instances of substandard testing results;
- a discussion of agreements made between the interested parties which may affect the work; and
- signature of the respective CQA Site Manager.

2.3 Interim Status Reports

During remediation activities at the Site, BRC will submit monthly status reports to the NDEP. The purpose of the monthly status reports will be to keep the NDEP informed of the progress of remediation activities at the Site. The reports will present a summary of the remediation progress during the previous month, including as appropriate, significant milestones in BRC CAMU construction, locations of completed pond and ditch excavation (including graphical format), and estimates of soil volumes excavated and placed in the BRC CAMU.

2.4 Annual Reports

BRC will submit an annual report of the solid wastes received at the site to the NDEP. This report will be submitted in a format mutually agreed to between BRC and NDEP. The report will consist of data reported in units of tons and cubic yards for waste materials received at the BRC CAMU.

The annual report will be submitted to NDEP and will include data compiled throughout the year. The total quantity of wastes deposited and the remaining capacity of the BRC CAMU in cubic yards will be incorporated. In addition, the leachate quality data will be compiled and the status of the leachate collection, including quantity of leachate collected on-site and disposed on a monthly basis, reported. Finally, any changes from the approved report, plans, and specifications, with justifications.

2.5 Biennial Reports

BRC will submit a biennial report by March 1 of each even year to the NDEP on EPA form 8700-13B. The report will summarize activities at the BRC CAMU for the previous two years. The report will contain: EPA identification number, BRC CAMU address, dates covered, description of wastes received, method of waste disposal, most recent closure and post-closure cost estimates, methods utilized to reduce waste volume, and any changes in waste volumes. This report will be signed by BRC.

3.0 POST CAMU CLOSURE REPORTING AND RECORDKEEPING

Maintenance inspection records will kept and maintained in a log book in order to clearly document any changes in physical conditions. Copies of the inspection report will be provided to the NDEP annually.

Results of monitoring will be kept and maintained onsite for a period of at least 30 years after closure. Copies of the monitoring will be provided to NDEP with the inspection report annually.

The condition of the facility will be documented with field notes, maps, and photographs, as appropriate. Evidence of potential compromises in the cover will be recorded including eroded patches, patches of dead vegetation, animal burrows, subsidence, and cracks along the cover. Surface water drainage features will be inspected for the presence of debris, physical integrity, and evidence of conditions that exceeded design assumptions.

1.3 The Endangered Species Act U-2
1.4 The Coastal Zone Management Act U-2
1.5 The Fish and Wildlife Coordination Act U-3

1.0 INTRODUCTION

This attachment discusses how the BRC CAMU is in compliance with the following Federal Laws.

1.1 The Wild and Scenic Rivers Act

The Wild and Scenic Rivers Acts protects river areas and their immediate environments for the present and future generations. Rivers are eligible for protection if they display one or more of the following characteristics:

1. *Wild river areas* -- Those rivers or sections of rivers that are free of impoundments and generally inaccessible except by trail, with watersheds or shorelines essentially primitive and waters unpolluted. These represent vestiges of primitive America.

2. *Scenic river areas* -- Those rivers or sections of rivers that are free of impoundments, with shorelines or watersheds still largely primitive and shorelines largely undeveloped, but accessible in places by roads.

3. *Recreational river areas* -- Those rivers or sections of rivers that are readily accessible by road or railroad, that may have some development along their shorelines, and that may have undergone some impoundment or diversion in the past.

There are no rivers in the vicinity of the BRC CAMU site with the exception of the Las Vegas Wash which is approximately 2 miles north of the Site, and the Las Vegas Wash is not designated as a Wild and Scenic River.

1.2 The National Historic Preservation Act of 1966

The National Historic Preservation Act protects, rehabilitates, restores and reconstructs the districts, sites, buildings, structures, and objects significant in American history, architecture, archaeology, or culture.

There are no locations of historical significance at the BRC CAMU site. BRC contacted the Nevada Natural Heritage Program and requested a search of their database. No locations of historical significance were identified as a result of this search. A copy of the seach result is provided in Appendix A to this Attachment.

1.3 The Endangered Species Act

The city of Henderson, along with other cities within Clark County, submitted an application to the EPA for a permit to incidentally take desert tortoises (*gopherus agassizii*), pursuant to section 10(a)(1)(B) of the Endangered Species Act of 1973, as amended (Act), in association with various proposed public and private projects in Clark County, Nevada. The permit allows incidental take of desert tortoises for a period of 30 years, resulting from development on up to 113,900 acres of private lands within Clark County, Nevada. The permit application was received September 28, 1994, and was accompanied by the Clark County Desert Conservation Plan (CCDCP), which serves as the Applicant's habitat conservation plan and details their proposed measures to minimize, monitor, and mitigate the impacts of the proposed take on the desert tortoise.

To minimize the impacts of take, Henderson provides a free pick-up and collection service for desert tortoises encountered in harm's way within the city. These desert tortoises will be made available for beneficial uses such as translocation studies and programs, research, education, zoos, museums, or other programs approved by the Service and Nevada Division of Wildlife. Sick or injured desert tortoises will be humanely euthanized.

Henderson approves the issuance of land development permits for otherwise lawful public and private project proponents during the 30-year period in which the proposed Federal permit is in effect. Henderson imposes a fee of $550 per acre of habitat disturbance to fund the measures to minimize and mitigate the impacts of the proposed action on desert tortoises.

The BRC CAMU will be in compliance with the Endangered Species Act through a fee of $550 per acre submitted with the grading permit application. If a Desert Tortoise is encountered during construction, the City of Henderson will be contacted and the tortoise relocated.

The above discussion notwithstanding, BRC does not believe that there are any threatened and endangered species in the CAMU area. BRC requested that Nevada Natural Heritage conduct a search related to such species. The letter from Nevada Natural Heritage provided in Appendix A to the Attachment confirms that there are no at risk taxa in this area.

1.4 The Coastal Zone Management Act

The Coastal Zone Management Act seeks to manage and preserve the nation’s coastal resources, ensuring their protection for future generation.

The BRC CAMU site is not located near any coasts.

1.5 The Fish and Wildlife Coordination Act

The Act provides that whenever the waters or channel of a body of water are modified by a department or agency of the U.S., the department or agency first shall consult with the U.S. Fish and Wildlife Service and with the head of the agency exercising administration over the wildlife resources of the state where construction will occur, with a view to the conservation of wildlife resources. The Act provides that land, water and interests may be acquired by federal construction agencies for wildlife conservation and development. In addition, real property under jurisdiction or control of a federal agency and no longer required by that agency can be utilized for wildlife conservation by the state agency exercising administration over wildlife resources upon that property.

The BRC CAMU will not modify the waters or channel of a body of water.

RE: Data request received 23 February 2007

Dear Mr. Sahu:

We are pleased to provide the information you requested on endangered, threatened, candidate, and/or At Risk plant and animal taxa recorded within or near the BRC Common Areas-CAMU Project area. We searched our database and maps for the following a 5 kilometer radius around including:

Township 22S Range 62E Sections 11 and 12

There are no at risk taxa recorded within the given area. However, habitat may be available for: the big free-tailed bat, *Nyctinomops macrotis*, a Nevada Bureau of Land Management (BLM) Sensitive Species; the spotted bat, *Euderma maculatum*, a Nevada BLM Special Status Species; the Arizona toad, *Bufo microscaphus*, a Nevada BLM Sensitive Species; the desert tortoise, *Gopherus agassizii*, a Federally Threatened Taxon; the chuckwalla, *Sauromalus ater*, a Nevada BLM Sensitive Species; and the banded Gila monster, *Heloderma suspectum cinctum*, a Nevada BLM Special Status Species. We do not have complete data on various raptors that may also occur in the area; for more information contact Ralph Phenix, Nevada Division of Wildlife at (775) 688-1565. Note that all cacti, yuccas, and Christmas trees are protected by Nevada state law (NRS 527.060-.120), including taxa not tracked by this office.

Please note that our data are dependent on the research and observations of many individuals and organizations, and in most cases are not the result of comprehensive or site-specific field surveys. Natural Heritage reports should never be regarded as final statements on the taxa or areas being considered, nor should they be substituted for on-site surveys required for environmental assessments.

Thank you for checking with our program. Please contact us for additional information or further assistance.

Sincerely,

Eric S. Miskow
Biologist III/Data Manager

Subject: Revised Remedial Action Plan Permit Application
Basic Remediation Company
Corrective Action Management Unit
Henderson, Nevada

Dear Mr. Denison:

Basic Remediation Company (BRC) is pleased to provide this Remedial Action Plan (RAP) Permit Application for the Corrective Action Management Unit (CAMU) located in Henderson, Nevada. The proposed BRC CAMU encompasses approximately 55 acres located within Sections 11 and 12 of Township 22 South, Range 62 East, in accordance with the Record of Decision (ROD) dated 2 November 2001.

This RAP is defined as a Resource Conservation Recovery Act (RCRA) permit that authorizes the disposal of remediation waste at a remediation waste management site. This permit application provides the information necessary to obtain a RAP as specified in 40 CFR 270, Subpart H. The proposed disposal unit is conservatively designed to meet the regulatory requirements for a CAMU, as referred to in 40 CFR 264.552.

As described in this application, the proposed disposal facility will be receiving remediation waste from the Basic Management, Inc., (BMI) Common Areas effluent ponds. Conceptual-level design, construction, and operations plans for the active and closed life of the facility are outlined in the enclosed Attachments. Additional details will be provided as part of a final design package. This application is for planning purposes only and is not intended to serve as a construction document.

If you have any questions or require additional information, please contact me at (702) 567 - 0465.

Sincerely,

Ranajit Sahu

Dr. Ranajit Sahu, C.E.M.
BRC Project Manager

1.0 INTRODUCTION

On behalf of Basic Remediation Company (BRC), GeoSyntec Consultants has prepared this REVISED Remedial Action Plan (RAP) permit application to operate a Remediation Waste Management System (RWMS) in Clark County, Nevada. A previous version of this document was submitted to the Nevada Division of Environmental Protection (NDEP) in January 2000 by Parsons Engineering Science of Pasadena, CA (Parsons, 2000). The NDEP requested in 2005 that the RAP be refreshed, and a draft document was submitted in response in March 2006. Based on the NDEP's comments to the March 2006 draft, this REVISED RAP has been prepared and is herewith submitted. This document includes the application and supporting documentation for a proposed Corrective Action Management Unit (CAMU), hereafter referred to as the BRC CAMU. This permit application is being submitted to the NDEP, Carson City, Nevada.

This application provides the information needed to obtain a RAP as specified in 40 CFR 270, Subpart H. In this context, a RAP is defined as a special form of RCRA permit that authorizes the disposal of remediation waste at a remediation waste management site. This type of permit was developed as part of the Hazardous Waste Identification Rule for Contaminated Media, or "HWIR-media rule" (63 FR 65874). As stated in the United States Environmental Protection Agency (USEPA) Environmental Fact Sheet on the Final HWIR-Media Rule (EPA530-F-98-029), this rule is designed to eliminate existing regulatory disincentives to remediation, make site cleanup faster and easier, and, thus, provide increased protection to human health and the environment.

As described in this application, the proposed disposal facility will only be receiving remediation waste. The proposed unit is conservatively designed to meet the regulatory requirements for a CAMU, as referred to in 40 CFR 264.552. This document provides conceptual-level design. Additional details will be provided as part of a final design package. Final design will be developed concurrently with review of the permit application.

The purpose of the proposed BRC CAMU is to provide a permitted disposal facility at the NDEP-approved location (per the Record of Decision dated 2 November 2001) for wastes generated during the voluntary cleanup of certain areas of the BMI Common Areas (the "Site"), as specifically contemplated by the "Nevada Division of Environmental Protection Settlement Agreement and Order on Consent: BMI Common Areas, Phase 3" (the "AOC3") dated February 15, 2006, and as defined in the

Corrective Action Plan (CAP) (BRC, 2006). Portions of the Site have been impacted during the legal disposal of various materials, including industrial wastes and cooling waters. The NDEP provides oversight of the voluntary cleanup activities. As a result of the NDEP's review of the "Remedial Alternatives Study (RAS) for the BMI Common Areas" (ERM, 1999), and subsequent discussion with BRC, the location stated in remedial alternative 4B was approved as the preferred location of waste materials generated from the voluntary cleanup of the Site. The actual text of the NDEP's comment is provided below for reference.

> "Per discussions with Basic Remediation Company (Robin Bain) on August 5, 1999, the Division assumes this alternative (4B in the RAS) has been modified to locate soils within the confines of BMI property immediately surrounding the current BMI Landfill. Based on currently available information, co-location of impacted soils with the BMI Landfill is the current preference of the Division for soil disposal."

2.0 BACKGROUND

The proposed BRC CAMU is located within Sections 11 and 12 of Township 22 South, Range 62 East, approximately 10,000 feet west-northwest of the intersection of Lake Mead Drive and Boulder Highway and approximately 3,500 feet west-southwest of intersection of Warm Springs Road and Boulder Highway (Attachment A). The site is approximately 13 miles south of the City of Las Vegas. The proposed BRC CAMU is located within the boundaries of the BMI Common Areas and is bordered on the north, east, and south by the BMI Industrial Complex. The BMI Industrial Complex consists of four operational plants west of Boulder Highway and north of Lake Mead Drive.

The proposed BRC CAMU is located within a 113-acre area northwest of the active plant area of the BMI Complex (Attachment B). Approximately 55 acres, the footprint of the BRC CAMU consists of two contiguous landfill areas, known as the North Mesa and South Mesa (Attachment B). The separate, distinct, and existing BMI Landfill occupies approximately 66 acres of this area and was initially used as effluent disposal ponds for the Basic Magnesium, Inc. magnesium refinery since its inception. Following shut-down of the refinery in November 1944, the two western-most ponds were converted to a solid waste disposal area which became known as the BMI Landfill. Use of this Landfill continued by successor operations until its closure in February 1980.

Immediately to the south of the BMI Landfill, a series of slit trenches were excavated during the 1950s through 1970s. A range of refuse and industrial wastes were placed into these slit trenches, the use of which was discontinued prior to 1980.

3.0 OVERVIEW

This permit application addresses the requirements for a RAP, as specified in 40 CFR 270. Table 1 of this permit application includes introductory material and citations of where each regulatory requirement is addressed in this application package. Attachment I contains site location information. Attachment R provides documentation of financial assurance.

Plans relating to Waste Characterization, Monitoring Programs, and Post-Closure are presented in Attachments C, N, and O respectively. The conceptual design for the proposed BRC CAMU is discussed in Attachment J. Drawings are provided in Section 1 of the Supplement RAP Information (SRAPI). Attachment C also includes a general discussion of the waste material to be disposed of in the landfill as well as provides summary tables of analytical data for these waste source areas.

A geotechnical evaluation of the site is presented in Section 8 of the SRAPI. The geotechnical study encompasses the proposed landfill (Borings B1 through B-12 and B-102) and Basic Environmental Company (BEC) property immediately to the west and northwest of the proposed landfill. In addition, boring logs for recent slit trench investigation work are presented in Section 8 of the SRAPI.

Attachment O includes discussion of the BRC CAMU Closure Plan with conceptual design parameters for the final cover along with supporting infiltration modeling information and conceptual design of the Final Cover System.

4.0 REQUIRED INFORMATION

This section outlines the information required for a RAP application, as specified in 63 FR 65942 and 40 CFR 270.110. For those requirements that call for detailed explanation or the use of drawings, reference is provided to the appropriate section or drawing within this document. Table 1 is provided as an outline of applicable regulatory requirements, with references to pertinent sections of this RAP application.

The following is a list of the RAP application questions and associated responses:

(a) The name, address, and USEPA identification number of the remediation waste management site;

BRC CAMU, Clark County, 22S/62E/11 and 12; EPA ID# NVD074150798

(b) The name, address, and telephone number of the owner and operator;

Basic Remediation Company, 875 West Warm Springs Road, Henderson, Nevada; Phone: 702-567-0400

(c) The latitude and longitude of the site;

Latitude: 36D 02M 56.23S N (36.048953 decimal degrees)
Longitude: 115D 00M 47.51S W (-115.013197 decimal degrees)

(d) The United States Geological Survey (USGS), or county map, showing the location of the remediation waste management site;

The proposed BRC CAMU site is located on the USGS Las Vegas SE, Nevada, Clark County quadrangle map. The site location is shown on Attachment A.

(e) A scaled drawing of the remediation waste management site showing:
1. The remediation waste management site boundaries;
2. Any significant physical structures; and
3. The boundary of all areas on-site where remediation waste is to be treated, stored, or disposed.

A scaled drawing showing all the required information is provided as Attachment B.

(f) A specification of the remediation waste to be treated, stored or disposed of at the facility or remediation waste management site. This must include information on:

1. Constituent concentrations and other properties of the remediation wastes that may affect how such materials should be treated and/or otherwise managed;

   Properties and constituent concentrations of the waste materials proposed for placement in the BRC CAMU are provided in Attachment C of this document, entitled "Waste Analysis Plan".

2. An estimate of the quantity of these wastes; and

   As noted in Attachment C, the estimated quantity of waste material is approximately 3.5 million cubic yards.

3. A description of the processes you will use to treat, store, or dispose of this waste, including technologies, handling systems, design and operating parameters you will use to treat hazardous remediation wastes before disposing of them according to the Land Disposal Restrictions (LDR) standards of part 268 of this chapter, as applicable.

   The process to be used in handling and disposal of the waste is outlined in Attachments C through P of this RAP permit application.

(g) Enough information to demonstrate that operations that follow the provisions in your RAP application will ensure compliance with applicable requirements of parts 264, 266, and 268 of this chapter;

Table 1 is provided as an outline of the applicable regulatory requirements, with references to pertinent sections of this RAP application, which demonstrate compliance.

(h) Such information as may be necessary to enable the Regional Administrator to carry out his duties under other Federal laws, as is required for traditional RCRA permits under 270.14(b)(20);

This RAP permit application is intended to provide sufficient information to enable the Regional Administrator to carry out his/her duties under other Federal Law, as is required for traditional RCRA permits under 270.14(b)(20).

(i) Any other information the Director decides is necessary for demonstrating compliance with this subpart or for determining any additional RAP conditions that are necessary to protect human health and the environment.

This RAP permit application is intended to provide sufficient information regarding siting, design, and operation to determine compliance with RAP conditions that are necessary to protect human health and the environment.

1.0 INTRODUCTION

The Basic Remediation Company (BRC) site-related chemicals (SRC) list, as approved by the Nevada Division of Environmental Protection (NDEP), currently includes a wide range of analytes, including many chemicals with universal treatment standards (UTS), as defined in Code of Federal Regulations (CFR) Title 40, Chapter 268.48 (40 CFR 268.48). The UTS list, with those constituents on the BRC SRC list identified, is shown in Table C-1. All areas where wastes are present or may be present based on visual evidence and an understanding of the Conceptual Site Model (CSM), along with measured or anticipated waste depths, are shown on Figure C-1. Although additional remediation may be required in areas not shown in order to meet project risk goals, wastes are not present in discernable quantities in other areas; therefore, sampling in areas not shown as containing wastes in Figure C-1 would not provide a realistic representation of waste composition (i.e., any samples collected will be unavoidably diluted with non-waste soils, thus rendering them unrepresentative of waste materials). Although sporadic waste sampling efforts have been conducted in the past within the BMI Common Areas, the recent Waste Sampling and Analysis effort in 2006 was a systematic attempt to characterize the wastes present in the Common Areas. This recent round of sampling also utilized the final SRC list for the BMI Common Areas, thereby providing the largest number of analytes for analysis. Thus, this most recent sampling provides the most complete characterization of the wastes and is summarized in this Attachment. It should be noted, however, that since these waste sampling results reflect the condition of the wastes as they are present in the source areas, there is likely to be some unavoidable commingling of wastes and non-waste materials during removal actions leading to dilution – thus, the characteristics of the wastes prior to placement in the CAMU may therefore be somewhat different. In this respect the results presented and discussed in this Attachment are conservative.

2.0 INVESTIGATIVE HISTORY

The 2006 waste characterization investigation, pursuant to an approved workplan by NDEP, focused on areas within the BMI Common Areas (Eastside) where wastes are located. Each of the samples collected from these areas was a composite grab sample in order to provide a representative concentration of the wastes present. Details of this compositing approach are shown in Table C-2 and Figure C-2, and Figures C-3A through C-3C.

The methodology for the solid matrix samples and waste water sample were in accordance with the project Field Sampling and Standard Operating Procedures (FSSOP; BRC and MWH 2006a) for surface and subsurface soil sample collection, including pre-field activities. The project Health and Safety Plan (HSP; BRC and MWH 2005) and Quality Assurance Project Plan (QAPP; BRC and MWH 2006b) prepared for the BMI

Common Areas were also used for this work. All work was completed under the direction of a State of Nevada Certified Environmental Manager (CEM).

The vast majority of the wastes present are soils and sediments; however, for completeness BRC also sampled the only wastewater present – namely in the TIMET Pond SW-12. This pond and the other TIMET ponds are no longer in service and the free water contained therein are evaporating. The primary purpose of the sampling effort was to (a) complete characterization of the remedial wastes in order to address certain regulatory requirements pertaining to their anticipated excavation and placement into the proposed CAMU; and (b) to assist with continued development of the BMI Common Areas (Eastside) CSM.

Waste characterization was performed to determine whether excavated materials comply with minimum treatment requirements (MTRs) prior to placement into a land disposal unit. As such the Waste Sampling and Analysis Plan (BRC, 2006) that was prepared and approved by the NDEP, with incorporated comments, complied with and was intended to support regulations at 40 CFR 270.110(f); 40 CFR 264(1)(j)(2); 40 CFR 264.552(d); 40 CFR 264.552(e)(2)&(4); and 40 CFR 268.49 (U.S. Environmental Protection Agency [USEPA] 2005).

Samples were collected from the following areas:

- Alpha ditch: composite samples were collected from three locations along the length of the alpha ditch. Each of the three sample locations consisted of composite samples from three equidistant locations (50 feet apart) and from two depths each.

- Beta ditch: composite samples were collected from three locations along the length of the beta ditch. Each of the three sample locations consisted of composite samples from three equidistant locations (50 feet apart) and from three depths each.

- IRM soil holding ponds: a single composite sample was collected from each of the IRM holding ponds – these are seven of the Upper Ponds. Each IRM holding pond sample consisted of composite samples from two locations within the holding pond and from two depths each. Since these ponds are capped for dust mitigation purposes, the upper sampling interval was below the cap.

- Mohawk area: a single composite sample was collected which consisted of samples from ponds PUE-01, PUE-02, PUF-01, and PUF-02 collected from surface soils.

- No-build area: three composite samples were collected which consisted of samples from ponds within the no-build area footprint. Each no-build area sample consisted of composite samples from four to five ponds each (as discussed in Table C-2) collected from surface soils.

- Sunset North area: a single composite sample was collected which consisted of samples from ponds west of the no-build area (as discussed in Table C-2) collected from surface soils. These ponds have undergone previous IRM activities.

- Spray Wheel: two composite samples were collected which consisted of samples from ponds with sediments within the Spray Wheel area. Each Spray Wheel sample consisted of composite samples from three to four ponds (as discussed in Table C-2) collected from two depths each.

- TIMET abandoned test pit: a single composite sample was collected which consisted of two samples from within the test pit footprint and from two depths each.

- Former Espey Construction site: a single composite sample was collected which consisted of two samples from within the construction site footprint and from two depths each.

- Other TIMET debris areas: a single composite sample was collected which consisted of samples from four areas identified as debris or storage areas (other than TIMET ponds, test pit or Espey Construction site). The other debris composite sample consisted of one sample from each of the four locations and from two depths each.

- TIMET berms: four composite samples were collected from berms between each of the TIMET ponds. Each sample consisted of composite samples from three locations from two depths each. Although the berms have not received any TIMET wastes, they were constructed via grading of historic BMI ponds located in this area.

- TIMET OPW ponds: two composite samples were collected which consisted of samples from each OPW pond. Each OPW pond sample consisted of composite samples from six to eight ponds each collected from two depths each. Only two samples were collected since the nature of the OPW wastes deposited in these ponds is uniform. A separate sample was collected from OPW Pond #12 since TIMET used this pond for disposal of lime bottoms. A single composite sample was collected consisting of samples from two locations within this pond and from two depths each.

- TIMET ponds: a single composite sample was collected from each of the 16 TIMET ponds. Each TIMET pond sample consisted of two composite samples from within the pond collected from two depths each. In addition, a wastewater sample was collected from Pond SW-12.

- Upper ponds: composite samples were collected, which consisted of samples from each of first seven upper pond rows from ponds with sediment (one composite sample per row). Each upper pond sample consisted of composite samples from four to six ponds each (as discussed in Table C-2) collected from two depths each.

Field sampling was conducted from July 26 through August 9, 2006. Through this effort, 53 soil samples and one sediment sample were collected for analyses, which were composited from 300 individual sample locations. A separate Data Validation

Summary Report (Dataset #39) was prepared and submitted to NDEP (BRC and MWH 2006c). This report was approved by the NDEP in November 2006. This report contains an electronic version of the waste characterization sampling database. Table C-3 summarizes the results of this investigation.

Table C-5 shows the estimated impacted soil volumes associated with the various waste areas. Figure C-4 shows the waste area locations.

3.0 RESULTS

A summary of the results of the waste sampling and analysis is provided in Table C-4. This table presents the minimum and maximum detected concentrations for each of the SRCs with a listed UTS, as defined in 40 CFR 268.48. The chemical-specific UTS times 10 and the chemicals that have been detected in concentrations that exceed 10 times their UTS are also indicated in Table C-4. Those chemicals with maximum concentrations that exceed 10 times their UTS are also compared to: 1) a potential carcinogenic direct risk from ingestion or inhalation at the site at or above 10^{-3}, and 2) a non-carcinogenic direct risk from ingestion or inhalation at the site an order of magnitude or greater over their reference dose. As discussed by USEPA (2002), hazard quotients are used as a measure of unacceptable exposure to constituents that produce toxic endpoints other than cancer.

USEPA Region 9 preliminary remediation goals (PRGs) tables provide exposure pathway-specific risk-based comparison values (USEPA 2004). These tables provide values for both carcinogenic and non-carcinogenic risks. If a particular chemical has both carcinogenic and non-carcinogenic toxicity criteria, these tables provide values for both these endpoints. Therefore, USEPA Region 9 residential PRGs for both carcinogenic and non-carcinogenic risks for the combined ingestion and inhalation exposure pathways were used in this analysis. Because PRGs for carcinogens are based on a cancer risk level of 10^{-6}, the values in the PRG tables were multiplied by 1,000 to obtain a 10^{-3} risk level. PRGs for non-carcinogens, which are based on a hazard quotient of 1, were multiplied by 10. These adjusted PRG values are shown in Table C-4 for those chemicals that exceeded 10 times their UTS. These chemicals were 2,4'-DDE, 4,4'-DDD, 4,4'-DDE, 4,4'-DDT, beta-BHC, 1,2,3,4,6,7,8-HpCDD, 1,2,3,4,6,7,8-HpCDF, 1,2,3,4,7,8,9-HpCDF, OCDD, and OCDF. Because PRG values were not available for 2,4'-DDE, values for 4,4'-DDE were used as a surrogate. PRG values for each of the dioxin congeners were obtained by multiplying the PRG for 2,3,7,8-TCDD by each congener's respective toxicity equivalency factor (TEF). All of the chemicals are considered carcinogens and have PRGs for carcinogenic risks. 4,4'-DDT and beta-BHC also have PRGs for non-carcinogenic risks. As indicated in Table C-4, none of these chemicals equal or exceed either a potential carcinogenic direct risk from ingestion or inhalation of 10^{-3}, nor a non-carcinogenic direct risk from ingestion or inhalation an order

of magnitude or greater over their reference dose. Therefore, all of the waste materials in the Eastside meet the UTS/MTR requirements.

TABLE C-2
WASTE CHARACTERIZATION COMPOSITE SAMPLING
(Page 1 of 2)

Area / Sample ID	Spatial Composite	Depth Composite
Alpha Ditch		
WC-AD01*	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0 and 2 feet bgs
WC-AD02	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0 and 2 feet bgs
WC-AD03	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0 and 2 feet bgs
Beta Ditch		
WC-BD01	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0 , 6, and 11 feet bgs
WC-BD02	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0, 4, and 8 feet bgs
WC-BD03	composite of 3 (-50, 0, 50 feet) samples collected from along ditch	composite of samples collected from 0, 4, and 8 feet bgs
IRM Soil Holding Areas		
WC-IM01	composite of 2 samples collected from IRM soil holding area in pond PUA-04	composite of samples collected from 2 and 4 feet bgs
WC-IM02	composite of 2 samples collected from IRM soil holding area in pond PUB-04	composite of samples collected from 2 and 4 feet bgs
WC-IM03	composite of 2 samples collected from IRM soil holding area in pond PUB-05	composite of samples collected from 2 and 4 feet bgs
WC-IM04	composite of 2 samples collected from IRM soil holding area in pond PUB-10	composite of samples collected from 2 and 4 feet bgs
WC-IM05	composite of 2 samples collected from IRM soil holding area in pond PUC-03	composite of samples collected from 2 and 4 feet bgs
WC-IM06	composite of 2 samples collected from IRM soil holding area in pond PUC-04	composite of samples collected from 2 and 4 feet bgs
WC-IM07	composite of 2 samples collected from IRM soil holding area in pond PUD-03	composite of samples collected from 2 and 4 feet bgs
Mohawk Area		
WC-MH01	composite of one sample each from ponds PUE-01, PUE-02, PUF-01, and PUF-02	composite of samples collected from 0 feet bgs
No-Build Area		
WC-NB01	composite of one sample each from ponds PLH-01, PLI-01, PLI-02, PLJ-01, and PLJ-02	composite of samples collected from 0 feet bgs
WC-NB02	composite of one sample each from ponds PLH-02, PLH-03, PLH-04, and PLI-03	composite of samples collected from 0 feet bgs
WC-NB03	composite of one sample each from ponds PLG-02 through PLG-05	composite of samples collected from 0 feet bgs
Sunset North Area		
WC-SN01	composite of one sample each from ponds PLD-10, PLE-08, PLE-09, PLF-05 through PLF-08, and PLG-06	composite of samples collected from 0 feet bgs
Spray Wheel		
WC-SW01	composite of one sample each from ponds PUE-08, PUE-09, PUF-08, and PUF-09	composite of samples collected from 0 and 2 feet bgs
WC-SW02	composite of one sample each from ponds PUF-07, PUG-08, and PUH-07	composite of samples collected from 0 and 2 feet bgs
Former Espey Construction Site		
WC-TE01	composite of two samples from footprint of former Espey Construction site	composite of samples collected from 0 and 2 feet bgs
Other TIMET Debris Areas		
WC-TD01	composite of one sample each from footprint of three other TIMET debris areas	composite of samples collected from 0 and 2 feet bgs
TIMET Abandoned Test Pit		
WC-TA01	composite of two samples from footprint of TIMET Abandoned Test Pit	composite of samples collected from 0 and 3 feet bgs

TABLE C-2
WASTE CHARACTERIZATION COMPOSITE SAMPLING
(Page 2 of 2)

Area / Sample ID	Spatial Composite	Depth Composite
TIMET Berms		
WC-TB01	composite of 3 equispaced samples from western berms between TIMET ponds	composite of samples collected from 0 and 2 feet bgs
WC-TB02	composite of 3 equispaced samples from central west berms between TIMET ponds	composite of samples collected from 0 and 2 feet bgs
WC-TB03	composite of 3 equispaced samples from central east berms between TIMET ponds	composite of samples collected from 0 and 2 feet bgs
WC-TB04	composite of 3 equispaced samples from eastern berms between TIMET ponds	composite of samples collected from 0 and 2 feet bgs
TIMET OPW Ponds		
WC-TW01	composite of one sample each from ponds OPW-6 through OPW-11	composite of samples collected from 0 and 3 feet bgs
WC-TW02	composite of one sample each from ponds OPW-13 through OPW-20	composite of samples collected from 0 and 3 feet bgs
WC-TW03	composite of two samples from pond OPW-12	composite of samples collected from 0 and 3 feet bgs
TIMET Ponds		
WC-TP01	composite of 2 samples from pond SC-1	composite of samples collected from 0 and 5 feet bgs
WC-TP02	composite of 2 samples from pond SW-2	composite of samples collected from 0 and 2 feet bgs
WC-TP03	composite of 2 samples from pond SW-3	composite of samples collected from 0 and 2 feet bgs
WC-TP04	composite of 2 samples from pond SW-4	composite of samples collected from 0 and 5 feet bgs
WC-TP05	composite of 2 samples from pond SW-5	composite of samples collected from 0 and 2 feet bgs

WC-TP14	composite of 2 samples from pond HP-3	composite of samples collected from 0 and 2 feet bgs
WC-TP15	composite of 2 samples from pond HP-4	composite of samples collected from 0 and 2 feet bgs
WC-TP16	composite of 2 samples from pond HP-5	composite of samples collected from 0 and 2 feet bgs
Upper Ponds		
WC-UP01	composite of one sample each from ponds PUA-05 through PUA-10	composite of samples collected from 0 and 2 feet bgs
WC-UP02	composite of one sample each from ponds PUB-06 through PUB-09	composite of samples collected from 0 and 2 feet bgs
WC-UP03	composite of one sample each from ponds PUC-05 through PUC-08	composite of samples collected from 0 and 2 feet bgs
WC-UP04	composite of one sample each from ponds PUD-04 through PUD-09	composite of samples collected from 0 and 2 feet bgs
WC-UP05	composite of one sample each from ponds PUE-03 through PUE-07	composite of samples collected from 0 and 2 feet bgs
WC-UP06	composite of one sample each from ponds PUF-03 through PUF-06	composite of samples collected from 0 and 2 feet bgs
WC-UP07	composite of one sample each from ponds PUG-04 through PUG-07	composite of samples collected from 0 and 2 feet bgs

Note: Wastewater sample collected from TIMET Pond SW-12.

*Indicates BMI Siphon sample location.

1.0 INTRODUCTION

This Security Plan describes the procedures and barriers that will be used to prevent persons who are unaware of the danger from entering the Remedial Waste Management System (RWMS). In addition, this plan also includes measures to minimize the possibility of unauthorized entry by persons or livestock onto the active portion of the RWMS.

2.0 PERSONNEL

Six to eight full-time employees, not including contractor employees, will be onsite during construction operations. In addition, at least one person will be present 24 hours a day, 7 days a week during the length of the remediation project. The following is a list of assigned personnel and their responsibilities:

- BRC CAMU Construction Manager –The Construction Manager will be on site at least 50 percent (50%) of the time the site is open for waste disposal to oversee site operations. The Construction Manager will be responsible for keys to the site gates.
- Equipment Operators – The primary responsibility of these (two) positions is the normal construction and operational duties associated with the landfill operations, including spotting vehicles, spreading and compaction of waste material, landfill attendant duties, and installation of earthen cover. Equipment operators will report to the BRC CAMU Construction Manager.
- Laborers – Typical duties will include site and roadway construction, maintenance, and cleanup, as determined by the BRC CAMU Construction Manager. In addition, a minimum of one employee will be assigned the job of daily policing the site perimeter, providing directions to disposal locations, monitoring received waste and collecting management data. Laborers will report to the BRC CAMU Construction Manager.
- Security Guards – Full-time security guards, on-site during non-working hours or using remote video equipment, will be responsible for site access, daily monitoring of the condition of the perimeter fence, and communicating problems to the BRC CAMU Construction Manager. During working hours, a Laborer will be responsible for site access, daily monitoring of the condition of the perimeter fence, and communicating problems to the BRC CAMU Construction Manager.

3.0 SITE CONTROL

3.1 Fencing and Gates

Primary site access will be gained through the entry gate located off Fourth Street on the east side of the property. The entry gate will be equipped with a lockable mechanism to prevent unauthorized entry and/or uncontrolled waste deposition when the site is closed. The gates will remain locked except during periods of continuous ingress/egress (i.e., during transport of materials to the BRC CAMU). Access to the site at points other than the entry gate will be discouraged by maintenance of site perimeter fencing and full time security during site operations. The Fence Plan is shown on Figure J-12 in Section 1 of the Supplemental RAP Information (SRAPI).

BRC will implement a monitoring program to identify and repair breaches in the perimeter fence line. This program includes new fence installation as part of remediation activities and continues after final remediation completion.

3.2 Access

Access to the site will be controlled by a security guard during non-working hours and site personnel during working hours. In addition, artificial barriers will be used to protect public health, safety, and the environment. The BRC CAMU entrance or gate attendant's office, located beyond the entry gate, will serve as the checkpoint to facilitate access and traffic control. Loads will be inspected at this point by assigned site personnel. During specified working hours, waste materials approved for acceptance will be directed to the active landfill working face.

Additional site controls will be employed to control traffic flow, including pedestrian traffic, within the Site during remediation. These site controls are necessary to control remediation workers, vendors and subcontractors, and Site visitors. Site visitors will not be allowed to access the exclusion zone. Visitors will be allowed access if they provide proof of current Title 29 CFR.1910.120, they "sign in" as authorized visitors, and they attend a required Health and Safety tailgate briefing.

3.3 Signs

Bilingual Signs will be posted that clearly indicate the following:

- The owner and operator of the site;
- The hours of operation;
- Materials accepted or excluded; and

- The site is private property and is not open to the public for public disposal of any waste materials whatsoever.

At the main entrance gate off Fourth Street an easily visible sign will be posted indicating the facility name, and other pertinent information as required. The sign will include the name of the site operator, the operator's telephone number, and hours of operation. It will be noted on the signage that the BRC CAMU is a private operation.

Instructional signs will be placed at this site entrance addressing prescribed safety measures on the site and include instructions regarding prohibition of smoking within the disposal areas and mandating that all instruction from site personnel be obeyed.

Interior site haul roads will be appropriately signed so as to direct each load to its designated disposal area. Typical directional and information signs will be posted at the site. Location of signage may be changed from time-to-time to facilitate operations. In addition, authorized personnel may be utilized to direct traffic at the active working face of the landfill operation.

Signs stating "Danger—Unauthorized Personnel Keep Out" will be posted at each entrance to the active portion of the facility, and at other locations, in sufficient numbers to be seen from any approach to the active portion of the site.

"No Trespassing" signs will be posted at 100-foot intervals along the site perimeter fencing. Additional signs and/or measures may be required to protect personnel and public health and safety. All signs will be legible from a distance of at least 25 feet.

3.4 Lighting

Lighting will be provided at the main entrance to illuminate the gate and signs. During night time construction, temporary lighting will be used within areas of the site where work is being performed.

4.0 COMMUNICATION

Security guards will have mobile phones for communicating with the Construction Manager and local police and fire services personnel, as necessary. Breaches in security will be reported to the Construction Manager for immediate repair and correction.

On-site communication will be through two-way radios or mobile phones. Operators will use radio or mobile phone technology to communicate with security personnel to report emergencies, injuries, etc.

Appendices

Appendix A – Inspection Checklists

1.0 INTRODUCTION

This Inspection Plan includes the items, areas, units, and equipment that will be inspected during the construction and operation of the BRC CAMU to identify malfunctions, deterioration, operator errors, and discharges that may be causing, or may lead to, a release of waste constituents to the environment or a threat to human health. Inspections performed during the post-closure care period are discussed in Attachment O. This plan includes checklists, schedules, and qualifications of personnel charged to perform inspections. A separate Construction Quality Assurance (CQA) Plan for the construction of the base liner system is included in Supplemental RAP Information (SRAPI), Section 3 and a separate CQA Plan for the construction of the final cover system is included in SRAPI, Section 6.

BRC will inspect monitoring equipment, safety and emergency equipment, security devices, and operating and structural equipment (such as dikes and sump pumps) that are important to preventing, detecting, or responding to environmental or human health hazards. Inspection checklists will be kept on site and will identify the types of problems (e.g., malfunctions or deterioration) which are to be looked for during the inspection (e.g., inoperative sump pump, leaking fitting, erosion, etc.). Inspection checklists are included as Appendix A.

1.1 Personnel

To develop and maintain the overall BRC CAMU in conformance with the inspection standards outlined in this document, four to five employees or contractors will be assigned, as required, to site inspections. Other employees or contractors will be assigned, as needed, for support activities.

The following is a list of assigned personnel with a brief outline of their qualifications:

- BRC Construction Manager – A BRC Construction Manager will maintain an operational/maintenance office onsite. This individual will be directly responsible for all site-related inspection activities. The BRC Construction Manager shall assign inspection duties, ensure all activities are performed on schedule, and maintain records in accordance with this plan and the Reports and Recordkeeping Plan (Attachment T). This individual will report to the Project Manager.

- Equipment Operators – Employees (two) serving in this capacity will possess experience and training in the fields of heavy equipment operation and earth movement and construction activities. The primary inspection responsibilities of

these positions include equipment and additional inspections as directed by the BRC Construction Manager. Equipment operators will report to the BRC Construction Manager.

- Laborer – Typical duties will include site and roadway construction, maintenance, and cleanup, as determined by the BRC CAMU Construction Manager. One employee will be assigned the job of daily policing the site perimeter and regulation of site access, providing directions to disposal locations, monitoring received waste and collecting management data. One employee will be assigned to air monitoring.

BRC is committed to placing and maintaining individuals with the overall training, experience, capabilities, and/or other qualifications in the above noted positions as necessary to operate and develop the site in such a manner as to meet or exceed applicable requirements and regulations. Additional equipment and personnel will be provided as required to accomplish overall site maintenance and operation standards, which equal or exceed all applicable State and local rules and regulations pertaining to site safety measures and the overall general protection of the area's environment.

2.0 OPERATIONAL INSPECTIONS

2.1 Health and Safety

Health and Safety inspections will be performed as outlined in the Accident Prevention, Contingency, and Emergency Response Plan (Attachment G). These inspections will be carried out by the BRC CAMU Construction Manager or his/her designee. The Health and Safety inspections include verifying PPE and communication devices are in good, working condition, inspection of safe work practices, and verifying personnel has received proper health and safety training. If conditions are found to be unsafe through inspections, the Project Manager will halt work and address problems. Examples of unsafe conditions are: Personal Protective Equipment (PPE) or radio/communication malfunction, severe weather, and/or fire.

2.2 Air Monitoring

Inspections associated with off-site dust transport are covered in detail in Appendix B, Perimeter Air Monitoring Program (PAMP), of the Corrective Action Plan (CAP). During waste placement within the BRC CAMU, air monitoring and sampling will be performed continuously, with a MIE® DATA RAM sampler that is calibrated prior to sampling each day. General site, breathing zone, and perimeter air monitoring will be conducted during construction operations. Personal air monitoring will be conducted if breathing zone or work zone monitoring results indicates that exposures

over the action level may have occurred. All sampling results will be included in the Corrective Action Completion Report to be submitted to NDEP following BRC CAMU closure. If the airborne concentrations exceed the action levels as prescribed in Section 4.0 of the PAMP, the BRC Project Manager will immediately stop work and modify dust control measures.

2.3 Hauling/Transport

Haul routes will be inspected on a daily basis by the BRC CAMU Construction Manager during hauling operations. Condition of the haul routes will be evaluated daily to determine if repairs are required. Repairs will be made when rutting, drainage, or other issues impact the transport of the waste materials.

Hauling/transport equipment will be kept in good working order and will have covers over the load. Standard construction entrance features (rumble strips and large aggregate aprons) will be used to remove soil from vehicle wheels departing the BRC CAMU site. Sweeper and vacuum trucks will be used daily to maintain haul routes. Further details are found in the CAP.

2.4 Surface Water

The BRC CAMU Construction Manager or his/her designee will be responsible for inspecting the storm water collection system after precipitation events (i.e. post storm) exceeding ½ inch in a 24 hour period and will evaluate erosion, sedimentation, and other damage, if any. In addition, the post storm inspection will be performed to evaluate the potential for surface water infiltration into the BRC CAMU. Surface water conveyance features will be inspected quarterly during the dry season and weekly during the wet season for sediment and debris accumulation. Collection and holding facilities will be inspected for sediment build-up and debris after precipitation events (i.e. post storm) exceeding ½ inch in a 24 hour period to maintain conveyance and design capacity.

Accumulated surface water, which has not entered the waste containing areas of the BRC CAMU, will be removed as soon as practical. An operational pump and appurtenant equipment will be maintained on-site during the entirety of the project (and not just during typically wet periods of the year) to be used in surface water removal. Accumulated surface water, which has contacted the waste material, will be treated as leachate and handled accordingly.

2.5 Leachate

Prior to completion of the final cover system, the BRC CAMU Construction Manager or his/her designee will be responsible for monitoring leachate levels in sumps

each week. If the leachate level exceeds 2-feet, the sump will be drained of leachate and used for dust control overlying lined areas of the BRC CAMU that have not been capped, in accordance with the BRC CAMU Operation Plan (Attachment M).

After completion of the final cover system, the leachate levels will be monitored on a quarterly basis for a period of two years and annually thereafter, see Attachment O (Closure and Post-Closure Plan). Leachate will be taken off-site for proper disposal in accordance with BRC CAMU Operation Plan (Attachment M).

2.6 Gates and Fences

The 24-hr site security guards will inspect the fences and gates daily to ensure all are in proper working order. In addition, the security guard will note any missing or damaged signs around the property as well as evidence of unauthorized access. Damages will be recorded and repairs performed immediately to minimize unauthorized site access.

2.7 Liner and Cover Systems

During construction and installation, liners and cover systems will be inspected regularly for uniformity, damage, and imperfections (e.g., holes, cracks, thin spots, or foreign materials) as outlined in the construction quality assurance plans for the base liner system and final cover system. Details of liner and cover construction quality assurance are provided in the Construction Plan (Attachment L) and Closure and Post-Closure Plan (Attachment O), respectively. The liner system will be inspected weekly during waste placement activities to verify the system remains undamaged. If damage occurs, work activities in the area of the damage will halt while damage is repaired.

2.8 Equipment

During construction activities, all equipment in operation will be inspected daily by the equipment operator. BRC will also inspect and track on-site equipment to ensure that it is in good working order. Inspections will be performed by equipment operators to ensure equipment is in good working order. Equipment which is not in good working order will not be used until repaired or replaced.

2.9 Best Management Practices

Best management practices (BMPs) will be inspected weekly and after storm events to verify they are in good, working condition. If inspections indicate BMPs are damaged, they will be replaced.

3.0 RECORDKEEPING

The BRC CAMU Construction Manager will record inspections in an inspection log. These records will be kept in accordance with the records retention requirements of the AOC3. At a minimum, these records will include the date and time of the inspection, the name of the inspector, a notation of the observations made, and the date and nature of any repairs or other remedial actions. Inspection checklists are included as Appendix A.

Appendix C – Organizational Flowchart

1.0 INTRODUCTION

This Personnel Training Plan describes the personnel and classroom or on-the-job training workers and other site personnel receive on how to perform their duties in a way that ensures the BRC CAMU complies with the conditions of this RAP and how to respond effectively to emergencies.

1.1 Personnel

To develop and maintain the overall BRC CAMU in conformance with the design and operational standards outlined in this document, three to four employees or contractors will be assigned, as required, to site operations. Other employees or contractors will be assigned, as needed, for support activities.

The following is a list of on-site personnel with a brief outline of their qualifications:

- BRC CAMU Construction Manager –The Construction Manager will be on site at least 50 percent (50%) of the time the site is open for waste disposal to oversee site operations. The Construction Manager will be responsible for keys to the site gates.
- Equipment Operators – The primary responsibility of these (two) positions is the normal construction and operational duties associated with the landfill operations, including spotting vehicles, spreading and compaction of waste material, landfill attendant duties, and installation of earthen cover. Equipment operators will report to the BRC CAMU Construction Manager.
- Laborers – Typical duties will include site and roadway construction, maintenance, and cleanup, as determined by the BRC CAMU Construction Manager. In addition, a minimum of one employee will be assigned the job of daily policing the site perimeter, providing directions to disposal locations, monitoring received waste and collecting management data. Laborers will report to the BRC CAMU Construction Manager.
- Security Guards – Full-time security guards, on-site during non-working hours or using remote video equipment, will be responsible for site access, daily monitoring of the condition of the perimeter fence, and communicating problems to the BRC CAMU Construction Manager. During working hours, a Laborer will be responsible for site access, daily monitoring of the condition of the perimeter fence, and communicating problems to the BRC CAMU Construction Manager.

2.0 TRAINING

BRC is committed to placing and maintaining individuals with such overall training, experience, capabilities, and/or other qualifications in the above noted positions as necessary to operate and develop the site in such a manner as to meet or exceed applicable requirements and regulations. Additional equipment and personnel will be provided as required to accomplish overall site maintenance and operation standards, which equal or exceed all applicable State and local rules and regulations pertaining to site safety measures, and the overall general protection of the area's environment.

Non-office site personnel will receive 40-hr Occupational Safety and Health Administration (OSHA) Hazardous Waste Operations and Emergency Response Standards (HAZWOPER) training, which will be provided by certified trainers. Personnel will renew this training annually with the 8-hr refresher course. Employees using a Nuclear Density Gauge will be required to have completed the 8-hour Nuclear Density Safety Course, which will be provided by a certified trainer (e.g. Troxler Electronics, etc.). Prior to beginning work at the CAMU site, employees, contractors, and subcontractor personnel are required to submit all applicable training certificates to BRC to be maintained and stored in accordance with the Report and Record Keeping Plan (Attachment T). The task supervisor will be responsible for providing the Construction Manager with records of training. The following table lists the training required for specific work tasks and personnel working at the CAMU site. Select course descriptions are provided in Appendix A.

Work Task	Training	Personnel Required to be Trained	Documentation Required
All work at the CAMU site	40 hour OSHA HAZWOPER	All on-site personnel	Certificate from certified training meeting 29 CFR 1910
All work at the CAMU site	8 hour OSHA refresher	All on-site personnel	Certificate from certified training meeting 29 CFR 1910
All work at the CAMU site	8 hour OSHA Supervisor Training	On-site supervisors	Certificate from certified training meeting
All work at the CAMU site	Respirator Fit Test	All on-site personnel	Certificate from certified trainer
All work at the CAMU site	Red Cross First Aid and CPR	On-site supervisors	Certificate from Red Cross
Liner system – geomembrane installation	Manufacturer training on seaming geomembrane	Geomembrane installation technicians	Approval letter from geomembrane manufacturer
Liner system –	Qualifications and	Geosynthetic material	Qualifications and

geosynthetic material installation	experience installing similar materials	installation technicians	resumes of personnel responsible for installing geosynthetic materials
Soil/waste moisture / density testing	8 hour Nuclear Density Safety Training	CQA monitor testing fill and waste moisture / density	Certificate from certified trainer
Landfill operations management	SWANA Manager of Landfill Operations Training	Landfill manager	Certificate from certified SWANA trainer
HDPE pipe joining	Manufacturer Butt-Fusion Training	HDPE pipe joining technicians	Certificate from certified trainer

Additional site specific training will be conducted and recorded by task supervisors related to their work tasks. Site specific training is discussed in Section 2.2.

2.1 Construction Manager Training

In addition to OSHA 40-hr HAZWOPER Training, the Construction Manager will receive the OSHA 8-hr HAZWOPER Supervisor course. The Construction Manager will be responsible for providing a health and safety training for site personnel to become familiar BRC CAMU-specific procedures. The BRC CAMU Construction Manager will keep records on names and dates of those who attended and passed training.

The Construction Manager will also be responsible for conducting pre-entry brief meetings and tailgate safety meetings. He/she will verify monitoring equipment and personal protective equipment is operational and will be responsible for verifying monitoring equipment has been calibrated. The Construction Manager will also be responsible for weekly inspections.

2.2 Equipment Operator and Laborer Training

In addition to OSHA 40-hr HAZWOPER training, employees shall receive BRC CAMU-specific training covering:

- Procedures for using, inspecting, repairing, and replacing facility emergency and monitoring equipment: Personnel receive instruction in the use of emergency and monitoring equipment described in the Attachment G. Personnel will be trained to inspect all facility emergency and monitoring equipment to mitigate the effects of equipment failure in the Inspection Plan. In addition, personnel will be trained in the use of emergency equipment in their job areas (e.g. fire extinguishers, respirators, etc.);

- Key parameters for equipment automatic shut-off: Plant and equipment operators will receive on-the-job training for automatic shut down of equipment in their work areas;
- Communications or alarm systems: Facility employees will be instructed as to the location and use of all telephones, intercoms, sirens, alarms, and two-way radios;
- Responses to fires or explosions: Personnel will receive fire prevention training and fire response;
- Response to spills: Personnel will receive instruction in spill and release prevention and response ; and
- Shutdowns of operations: Personnel will receive instruction in shutdown procedures during BRC CAMU operation. Personnel with operational responsibilities are instructed in procedures for planned and unplanned shutdowns during on-the-job training.

Training sessions will be held quarterly to review new health and safety hazards and provide new employees with training. The employees will be familiar with contingency plans to deal with accidents, injuries, fires, explosions, or natural disasters as outlined in Attachment G, Accident Prevention, Contingency, and Emergency Response Plan.

2.3 Post-Closure Personnel Training

Post-closure care personnel will have received adequate training in their specific job duties. This includes OSHA 24-hour health-and-safety training as well as pertinent training in BRC CAMU maintenance procedures. In addition, staff will be trained on emergency procedures and contacts as well as hazards they may encounter at the BRC CAMU. This post-closure staff will consist of a facility manager and various staff workers as needed. The name, address, and telephone number of the facility manager will be provided to the NDEP during the closure process.

3.0 RECORDKEEPING

The BRC will maintain the following documents and records for each hazardous waste management related position at the facility:

- The job title for each position
- The name of the employee filling each position
- A written job description including requisite skill, education, or other qualifications
- Duties of employees assigned
- Description of training
- Records documenting completion of training

The Construction Manager will maintain records at their onsite facilities. All records will be kept in accordance with the record retention requirements of the AOC3.

Appendix A
Training Course Descriptions

HAZWOPER 40 Hour Course

OSHACAMPUS.com™
powered by 360training

Course Description

This course covers broad issues pertaining to the hazard recognition at work sites. OSHA has developed the HAZWOPER program to protect the workers working at hazardous sites and devised extensive regulations to ensure their safety and health. This course, while identifying different types of hazards, also suggests possible precautions and protective measures to reduce or eliminate hazards at the work place. It is specifically designed for workers who are involved in clean-up operations, voluntary clean-up operations, emergency response operations, and storage, disposal, or treatment of hazardous substances or uncontrolled hazardous waste sites. Topics include: protection against hazardous chemicals, elimination of hazardous chemicals, safety of workers and the environment, and OSHA regulations. This course covers topics included in 29 CFR 1910.120.

Regulatory

This course meets the in class training requirements of the 1910.120 standard. An additional 8 hours of hands on training is required to meet the training requirements of the standard.

Seat Time

This course has been approved for 40 hours.

Course Pre-Requisite

There are no pre-requisite requirements for this course. Upon successful completion of this course, you will be able to print your certificate.

Testing:

Quizzes: Lesson quizzes require no mastery. Quizzes at the end of each module require a passing grade to proceed to the next module. Final Exam: Final Exam must be passed with a 70% to pass the course. The final exam can be taken three times if necessary.

Topics Covered

- Regulation Overview
- Site Characterization
- Toxicology
- Hazard Recognition
- Hazard & Safety Analysis
- Hazardous Chemical Awareness
- Radiological Hazards
- Respiratory Protection
- Personal Protective Equipment
- Site Control
- Decontamination
- Medical Surveillance
- Air Monitoring
- Confined Space Entry
- Emergency Procedures
- Material Sampling

HAZWOPER 8 Hour Annual Refresher Course

OSHACAMPUS.com™
powered by 360training

Course Description

This course meets the requirements in OSHA 29 CFR 1910.120 for 8 hours of annual refresher training for workers at hazardous waste sites. This course is designed for general site workers who remove hazardous waste or who are exposed or potentially exposed to hazardous substances or health hazards. Topics include HAZWOPER regulations, safety and health plans, hazardous chemicals, safety hazards, air monitoring, medical surveillance, site control, decontamination, personal protective equipment, and respiratory equipment. This course covers the topics in OSHA 29 CFR 1910.120

Learning Objectives

- Read and understand OSHA regulations and requirements
- Use Site Characterization to identify hazards found in the workplace and steps to be taken to minimize hazards
- Understand the principles of toxicology and how they relate to various types of chemical exposures
- Develop a Medical Surveillance Program and understand its purpose
- Identify the uses for Personal Protective Equipment (PPE) and how to choose the correct PPE for a situation
- Understand the principles of decontamination as well as levels of decontamination and decontamination methods
- Have a better understanding of potentially hazardous situations involving corrosives, solvents, oxidizers, and reactive chemicals
- Understand the various considerations in an emergency and the importance of training and actions to personal safety and the safety of others

Topics Covered

- Regulation Overview
- Hazard Recognition
- Site Characterization, Analysis, and Control
- Toxicology
- Medical Surveillance
- Safe Work Practices and PPE
- Decontamination
- Chemical Awareness
- Emergency Procedures

Regulatory

Please refer to the state/regulatory requirement in the course catalog page.

Seat Time

This course has been approved for 8 hours

Course Pre-Requisite

Must have taken the 24 or 40 hour HAZWOPER course

Testing

Quizzes: All quizzes must be passed with a 100% to proceed to the next lesson. Final Exam: Final exam must be passed with a 70% to pass the next course. The final exam can be taken three times if necessary.

Standard First Aid with CPR/AED - Adult
American Red Cross First Aid with CPR/AED - Adult, trains participants to recognized ad care for life-threatening respiratory or cardiac emergencies in adults and provides the knowledge and skills needed to care for injury or sudden illness until professional medical help arrives. Training complements adult learning styles with hands-on practice and real-life scenarios while take-away materials serve as excellent refresher tools after training is complete. This comprehensive course meets training guidelines for first aid programs established by the Occupational Safety and Health Administration.
Topics covered include:
Recognizing and respond to an emergency.
How to care for a person who is choking.
Checking an unconscious person for life-threatening and nonlife-threatening conditions.
Recognizing and caring for a person who is not breathing.
How to care for a heart attack and how to give CPR.
Using and AED and identifying precautions when using and AED.
Identifying the signs and symptoms of sudden illness, including stroke, diabetic emergency, poisoning and allergic reactions and care for them.
Controlling bleeding.
Recognizing and caring for heat- and cold-related emergencies.

Fusion Machine Training Programs

Experience shows that improper installation, rather than faulty products, is the primary reason for system failures, delays, and cost overruns. Georg Fischer believes that the installation of our products is as important as the quality of the products we manufacture. In keeping with this belief, Georg Fischer offers several training courses.

BCF Welder Training

Course Description

Socket Fusion Training This four-hour course covers all aspects of hand-held and machine Socket Fusion Technology. Trainees will demonstrate their ability to perform socket fusion joining.	**Standard Butt Fusion Training (Conventional or CNC)** This four-hour course covers all aspects of Standard Butt Fusion Technology. Trainees will demonstrate

Upon successful completion and testing, the trainee will receive a Certificate of Completion and an Installer's Badge which may be worn on the job site.	their ability to prepare pipe, face pipe, heat and join piping.
IR Level I Welder Training This course covers fundamental training absolutely necessary for proper operation of the infrared (IR Plus) fusion machines. Topics: • Plastic pipe fundamentals • Infrared butt fusion • General information • Design/function/operation of the IR Plus fusion machines • Weld bead inspection • Basic machine maintenance Duration/Value: • 1 day/$250.00 per person Register now	**IR Level II Maintenance Training** Completion of this 16-hour (2 day) class allows the trainee to maintain external parts of the machine. Prerequisite: • All attendees must have completed the Georg Fischer IR Level I Welder Certification Program and Weld Inspection Program Topics: • Technical concepts of the machine • Machine inspections • Functional check • Maintenance procedures Level II • Alignment and adjustments • Weld evaluation • Documentation Duration/Value: • 2 days/$500.00 per person Register now
IR Level III Maintenance Training **(Authorization Required)** Completion of this 32-hour (4 day) class allows the trainee to maintain external and internal parts of the machine. This course is conducted at the Georg Fischer Tustin facility only. Prerequisite: • All attendees must have completed the Georg Fischer IR Level II Maintenance Training Topics: • Technical concepts of the machine • Machine inspections • Functional check • Maintenance procedures Level III • Alignment and adjustments • Weld Inspection Program • Documentation Duration/Value: • 4 days/$1,500.00 per person Register now	**IR Level III Refresher Training** **(Authorization Required)** This course is a refresher for Level III personnel and includes current updates for the IR 63, IR 225, and IR Plus machines. This course must be taken 1 year after the initial Level III course and then every two years after that. This course is condcuted at the Georg Fischer Tustin facility only. Prerequisite: • All attendees must have completed the Georg Fischer IR Welder Certification and IR Level II and Level III Maintenance Training. Duration/Value: • 2 days/$500.00 per person Register now
IR Weld Inspection Program (WIP) Upon completion of this eight-hour (1 day) class, the QU inspector will have a good basis to perform on-site visual IR weld evaluation. Topics: • Weld background • Terminology • Bead characteristics • Restmelt evaluation • Flow charts and checklist Duration/Value:	**BCF Welder Training** This four-hour course covers all aspects of using the BCF Flow Fusion Technology. Trainee will prepare pipe samples, insert and remove bladders, generate welds, and perform hot cleaning of the heater heads. Upon successful completion and testing, the trainee will receive a Certificate of Completion and an Installer's Badge which may be worn on the job site. Prerequisite: • All attendees must have completed the Georg Fischer IR Level I Welder Training

- 1 day/$250.00 per person

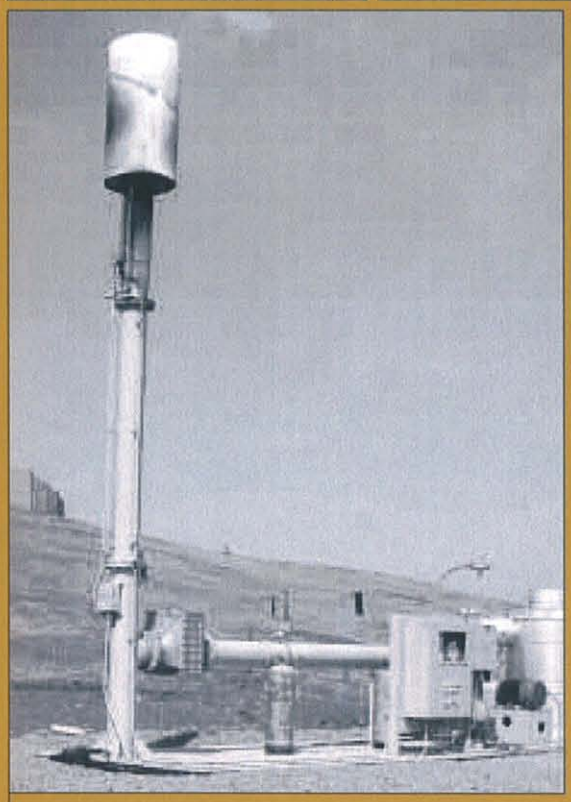
2007 TRAINING COURSE CATALOG

SWANA®

SOLID WASTE ASSOCIATION of North America

THE LEADING PROFESSIONAL ASSOCIATION IN THE SOLID WASTE FIELD



I AM**SWANA**

"Many people overlook the hard work and dedication necessary to perform a public service like solid waste management. SWANA's training courses make it possible for these men and women to operate at the highest level of performance with a sense of pride and achievement."

Bill Tobin | Director of Field Operations
Waste Authority of Montgomery County

Message from SWANA's President

INTRODUCTORY LETTER FROM TOM PARKER

Dear Colleague,

Thank you for choosing SWANA as the provider of all your training and professional development needs. For over 40 years, SWANA has thrived at the forefront of all training and education for municipal solid waste needs. This effort results from our first-and-foremost commitment to you, our members, but also to the field of solid waste.

The 2007 catalog contains training opportunities for you and all your staff. Whether you need training for professional development, for SWANA certification, or to maintain a current certification, SWANA offers specific education to fit your needs. This year SWANA Training takes place as several great locations beginning in Tampa, Fla., and closing out the year at WASTECON 2007 in Reno, Nev.

SWANA gives you what you need to stay ahead of them game with our new list of course offerings. We have updated the Manager of Landfill Operations Course (MOLO) and our ever-growing line of distance learning opportunities. With our increased offerings of E-Courses and E-Sessions, you can train individually at your desk or with your whole staff in a conference room to get the most out of your money! As with all SWANA events, in person and online, you will interact with and learn from some of the best and the brightest in the industry.

Thank you for your continued support of SWANA, and our mission to advance the practice of economically and environmentally sound management of municipal solid waste. I look forward to learning from you online or at one of our live events.

Sincerely,

Tom Parker, P.E
CDM, New Mexico
SWANA President

P.S. Receive the mark of professionalism in the solid waste industry with SWANA certification. SWANA offers eight different Certifications including the industry's only Bioreactor Landfill Certification. In this competitive landscape, it is integral to have an integrated MSW management background to efficiently manage your facility.

About the SWANA Training Catalog

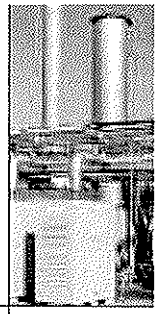
Congratulations on choosing SWANA for your professional development, training and certification!

For those of you who are new to SWANA: Welcome. To our over 7,700 loyal members, thank you for your continued support of SWANA's Technical Programs, and welcome to our new catalog format. Our new look has been designed to showcase SWANA's commitment to providing the best-in-class educational products to the entire solid waste industry. Today, SWANA continues that pledge with more educational products than ever before.

We hope the new format will make it easier for you to find just what you are looking for by using the following symbols to indicate the format of each product. Additional information including full course descriptions, is available on **www.SWANA.org** under "Educate".

- **SWANA Classroom Training:** Held at SWANA events throughout the year.
- **SWANA Chapter Partnering Events:** SWANA Chapters host additional SWANA training courses throughout North America.
- **E-Courses:** Traditional courses and brand new offerings that can be accessed from the convenience of your office. E-Courses are conducted through SWANA's web conferencing and teleconferencing system.
- **E-Sessions:** The best of SWANA's technical sessions brought to you each month through Web conferencing. These 75-minute sessions give you and your staff an opportunity to learn from the experts in this extended session. A different topic is covered every month.
- **E-Studies:** These self-paced, self-study options give you the training and the CEUs you need. All it takes is an internet browser.
- **On-Site Training:** Full training packages that you deliver to your staff at your own site and at your own pace.
- **Home Study Courses:** Written materials on important solid waste topics. Looking for CEUs – just pass the test that comes with the course and you'll qualify.
- **SWANA Training On Demand:** Do you have a group that needs to be trained and the next event isn't soon enough or your budget can't afford the cost? Let our best-in-class training come to you! Any of our courses can be customized to your needs. For quotes, contact **learn@SWANA.org**.

We love to hear about the training and educational products that you need. You can always reach us with your ideas, comments and feedback at **learn@SWANA.org**.



Getting SWANA Certified Easy As 1, 2, 3!

SWANA's Certification Training Courses

1. CHOOSE YOUR DISCIPLINE(S).

The Solid Waste Association of North America offers eight (8) certifications in the following solid waste disciplines:

- Landfill Management (MOLO)
- Bioreactor Landfill*
- Collections Systems
- Composting Programs
- Construction & Demolition Materials (C&D)
- Principles of MSW Management
- Recycling Systems
- Transfer Station Systems

* The Bioreactor Landfill certification requires candidates to hold a current SWANA Landfill management certification.

2. CHOOSE YOUR CERTIFICATION LEVEL.

Most SWANA Certifications offer at least two (2) eligibility levels, with an additional Inspector level offered to Landfill and Construction & Demolition SWANA Certification holders:

- **Technical Associate:** This level is ideal for professionals new to the industry and involved in the planning, design, implementation, operation or promotion of the MSW field. This would also include consultants, planners, vendors and regulators, etc. A minimum of a High School Degree or GED Required.
- **Manager:** This professional must meet all of the requirements of the Technical Associate level plus a minimum of five (5) years** experience in Municipal Solid Waste Management. Also required are at least two (2) years experience in a management/supervisory position*** in the discipline for which you are applying.

** 4-year degree in a related field may be substituted for up to 2 years of MSW experience
*** directly responsible for daily operations; compliance with design and permit conditions, utilization of field equipment and services, personnel needs, utilization and retention.

- **Inspector:** Unique to Landfill and Construction & Demolition certification holders, this professional must meet all of the requirements of the Technical Associate level as well as the ability to issue official citations for violations which require action/impose penalties. This professional must also be an active inspector with at least 2 years experience.

3. PASS THE SWANA CERTIFICATION EXAM FOR YOUR DISCIPLINE.

SWANA certification exams are offered at all SWANA and SWANA Chapter training events, even if the preparatory class is not being offered. You may only sit for one exam per testing session. You are not required to attend the preparatory training courses to become certified; however, it does reinforce your knowledge in a particular discipline. A passing score of 70% or above is needed to become SWANA certified. You will be allotted three (3) hours to complete your exam. All exams are proctored.

You may use calculators, preferably one capable of handling up to seven digits. Landfill Certification candidates may use MOLO scales for maps. The exam is a "closed book" exam so you may not bring manuals, worksheet or notes to the testing site. Before leaving the testing site, you will be asked to complete the SWANA Certification Application. Exam results will be mailed to the certification candidates within 60 days of the test date.

If you have any questions about becoming SWANA Certified, please contact us at **cert@SWANA.org**.

SWANA[DL] (Distance Learning)

SWANA CEUs are available for most SWANA Courses

Can't get away from work? Enjoy the industry's top training from the comfort of your home or office with SWANA[DL] (Distance Learning). With these courses, get the training you need in a format you want. SWANA[DL] allows you to train from your home or office, with your computer, or with home study manuals. Also by attending these courses, Certified Professionals can earn SWANA Continuing Education Units (CEUs). With SWANA[DL], training has never been easier!

E-COURSES

Learn, Earn and Return with these new online courses! You'll learn about a wide range of solid waste topics. Every course is taught by SWANA faculty. All you need is an internet connection and separate phone line and you're ready to learn. Each session lasts up to two hours, making SWANA training more convenient than ever! For a schedule of upcoming E-Courses, visit **www.SWANAstore.com** and click on E-Courses.

E-SESSIONS

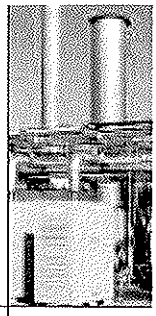
With these 75-minute presentations you can attend SWANA technical sessions all year long, from any location! These sessions bring you the latest on today's hot topics on the first three Wednesdays of the month. Each month focuses on a different area of MSW to keep you informed on all the current trends in solid waste. For a schedule of upcoming E-Session topics visit **www.SWANAstore.com** and click on E-Sessions.

E-STUDIES

Train your way with these self-paced online courses. These courses are completely online and are always a click away. The course also moves with you, so you spend your time on the areas that you need. Many of our courses also allow more than one user to train per account, with our new subscription-based pricing plan. Training has never been more flexible than it is with these courses!

Courses include:

- Landfill Operations
- Composting Operations
- Transfer Station Health and Safety
- Waste Screening
- Landfill Health and Safety
- Landfill Gas Primer
- Establishing An Electronics Recycling Program
- Integrated Solid Waste Management



SWANA[DL] (Distance Learning)

HOME STUDY COURSES ✉

Not quite ready for the world of online learning but still need convenient training? Well then look no further than SWANA Home Study Courses. Each course includes a manual that you review at your own pace. Once you're comfortable with the information, complete the enclosed exam. Score a 90% or better and you'll receive credit for the course. The manual also serves as a good reference once you've completed the course.

Courses include:

- Managing Landfill Gas at MSW Landfills
- Waste Screening at MSW Management Facilities
- Groundwater Monitoring, Sampling, Analysis & Construction
- Leachate Generation, Collection & Treatment at MSW Landfills
- Construction Waste and Demolition Debris Materials Manual

ON-SITE COURSES

Act as a trainer for your staff with these courses. Each course contains 8-10 hours of training, made up of smaller modules. This allows the courses to be tailor-made for your company.

Courses include:

- Training for Sanitary Landfill Operations Personnel
- Training for Collection Operations Personnel
- Waste Screening at MSW Management Facilities
- Health and Safety for MSW Landfill Training
- Health and Safety for MRF Personnel
- Health and Safety for Collection Personnel
- Health and Safety for Transfer Station Personnel

TRAIN YOUR WHOLE STAFF WITH SWANA E-TRAINING AND SAVE BIG!

When signing up for an E-Course or E-Sessions you register for one computer. By hooking up a projector and speaker phone, you could present E-Training to your whole staff for the cost of one registration, saving you big on training!

SWANA CEUs will only be allocated for registered individuals.

SWANA E-Training Calendar of Events

SWANA's E-Training allows you to receive the industry's best training from the comfort of your home or office. The Web seminars are the perfect way for busy professionals to stay current on the latest trends in the industry. These courses are always being updated in a continuing effort to bring you fresh, new training. The listing below is just a taste of what's to come. Keep an eye on **www.SWANAstore.com** for all the latest developments in SWANA's E-Training.

Have you attended a local training or technical session that you think all solid waste professionals could benefit from? Let us know! SWANA is always looking for ways to promote training that today's solid waste professionals can use. E-mail **learn@SWANA.org** with any topics or suggestions, as well as at which event the training was presented.

UPCOMING E-COURSES

*Course subjects and times subject to change. Visit **www.SWANAstore.com** for updated course listings.*

See page 28 for E-Course CEU information.

Fall 2006 Landfill Fire

Fall 2006 Erosion Control

Fall/Winter 2007 Electronics Recycling

Winter 2007 Landfill Operations

Winter 2007 Collections Operation

Winter 2007 Bioreactor Basics

*Have a course developed that you want to share online? Email **learn@SWANA.org** to find out how!*

UPCOMING E-SESSIONS *Tentative Schedule*

*Topics subject to change. Visit **www.SWANAstore.com** and click on E-Sessions for the latest information.*

Get 1 SWANA CEU for each E-Session (Registration required)

October 2006: Bioreactor Landfills

November 2006: Overcoming Challenges in Transfer Station Design and Operation

December 2006: Multi-Family and Institutional Recycling Programs

January 2007: Life Cycle of a Landfill – Strategies for Permitting, Designing, Operating and Closing

February 2007: Waste-to-Energy and Waste Conversion

March 2007: Special Waste Management

April 2007: Construction and Demolition Debris Management

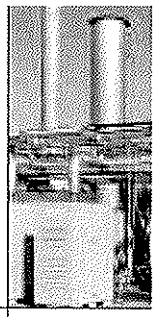
May 2007: Landfill Gas Control and Utilization

June 2007: Organics Management and Composting

July 2007: Boosting Recycling Rates: New and Innovative Programs

August 2007: Planning & Management

September 2007: Legislative and Regulatory Developments Impacting Solid Waste Management



SWANA Technical Divisions

SWANA's Premier Training Courses

Join one of SWANA's Technical Divisions and shape the future of solid waste management.

The Benefits include

- Access to cutting-edge information
  - TECHnews—electronic newsletter with the latest news in your specific field
  - SWANA's online eLibrary and Members Only section including the Division subscriber list
- Unmatched networking opportunities
  - Participate in an exchange of ideas with more than 2,700 Division Members
  - Receive a contact list of all Technical Division Subscribers
  - Make valuable contacts at conferences
  - Post and respond to questions through an electronic Technical Division Members list serve
- Shape the future of SWANA
  - Help develop programs for symposia
  - Guide technical policies and advocacy initiatives
  - Produce real change on industry issues
- Special discounts
  - $25 registration discount to your Division's annual symposium
  - Special discounts on publications, conference proceedings and training, and online educational sessions and events

For more information, visit **www.SWANA.org** or call **1-800-GO-SWANA (467-9262)**

MANAGER OF LANDFILL OPERATIONS (MOLO)

3-Day Certification Prep Course

Updated for 2007

Updated for 2007 for the Landfill Certification contains all the latest landfill techniques and technologies to keep you ahead of the competition. Learn to efficiently run your landfill, as well as gain knowledge on planning, operating and closing a landfill. Discuss issues surrounding regulatory standards, compliance with design requirements, and an introduction to state-of-the-art bioreactor landfill technologies. Upon completion of the course you will gain a better understanding of landfill economics, leachate and landfill gas management, and comprehend the importance of safety and contingency counter measures.

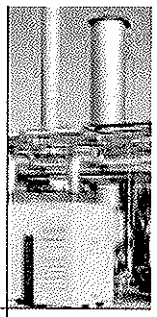
Need some help preparing for the MOLO, try these:

MOLO: JUST THE MATH E-COURSE

Planning to take the MOLO exam, but need to brush up on the math? With this live web course you can prepare for the math that is covered on the MOLO exam from your home or office. All you need is an internet connection and separate phone line and you're ready to learn the math. Taught by MOLO faculty, this course covers such calculations as elevation, area, slope, and volume. And because the course is only two hours long, you can learn and return to work. **MOLO: Just the Math does not allocate CEUs toward SWANA recertification.**

LANDFILL OPERATIONS

Need a boost to get ready for the MOLO or just need a refresher before taking the SWANA Landfill Certification Exam? Then get online with this new E-Study Course. Learn about such topics as Waste Decomposition, Geology and Hydrology, Landfill Design and Construction, General Operations, and Regulations from your computer. The course has also been enhanced with up-to-date photographs, audio, interactive exercises, related online links, and video to make learning more enjoyable.



Landfill and Landfill Gas Courses

SWANA's Premier Training Courses

THE WORLD'S ONLY BIOREACTOR LANDFILL CERTIFICATION PROGRAM

Technology is changing and bioreactor landfills are emerging. Now it is your turn to learn what bioreactors can do for you. Get career-enhancing certification by taking this prep course for the Bioreactor Landfill Certification exam. Examine the unique characteristics of a bioreactor landfill in comparison with dry tomb landfills in this brand new course. Explore the methods of introducing air and water into landfill cells, while at the same time discovering how this cutting-edge technology can increase landfill gas activity.

Special Publication: *Manager of Bioreactor Landfill Operations Body Of Knowledge*

The SWANA Manager of Bioreactor Landfill Operations Body Of Knowledge (BOK) is a compendium of the basic knowledge an individual must know to accomplish the work of a Manager of Bioreactor Landfill Operations. This BOK includes both proven traditional practices and the innovative, advanced practices of managing a bioreactor landfill, as well as empirical, esthetical, ethical and tacit knowledge. The Manager of Bioreactor Landfill Operations BOK is the basis of the SWANA Bioreactor Landfill course and certification exam.

The BOK consists of eight comprehensive knowledge statements covering the knowledge and abilities a manager of bioreactor landfills should have in the areas of construction, operation and monitoring of bioreactor landfills. You can use the BOK to prepare for the SWANA certification exam or as a tool for your operations.

Go to **www.SWANAstore.com** to order.

Landfill and Landfill Gas Courses

For SWANA CEU information, see pages 27-28.

LANDFILL OPERATIONAL ISSUES

2-Day Course/ 1-Day Workshop

This course is perfect for anyone interested in learning more about improving the daily operations at their landfill site. You will experience in-depth discussions that will help you solve everyday issues surrounding landfill operations and be able to understand successful landfill management practices, including equipment selection. Turn your landfill into a money maker by learning how to control cost, maximize your site's airspace, and determine if your landfill is really efficient. Upon completion of the course, you can earn valuable SWANA Continuing Education Units (CEUs). Furthermore, with your registration you will receive the book *The Handbook of Landfill Operations,* by Neal Bolton, P.E.

HEALTH AND SAFETY FOR MSW LANDFILL OPERATIONS PERSONNEL

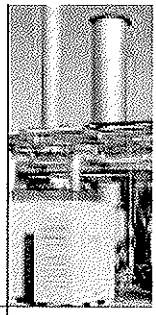
1-Day Course

Discover new horizons by enhancing your landfill health and safety program! This course prepares you to easily and intelligently identify and circumvent landfill health and safety issues. Not only will you learn exactly what elements constitute a proper loss control program, but you will understand the importance of establishing an effective program and overview OSHA and federal regulations. At the end of this course, participants will be able to recognize an unsafe practice and know how to handle it. Not only will you earn valuable SWANA Continuing Education Units (CEUs), but you will also gain imperative knowledge on how to keep your landfill safe.

LANDFILL GAS BASICS

1-Day Course

Don't waste landfill gas! Learn to "Control, Manage and Capture" it! These are the key concepts to successfully understanding landfill gas basics. Through exercises and case studies, SWANA instructors will help you grasp these three ideas in this introductory course. You will gain vital insight about gas regulations and become familiar with system design, construction and monitoring. In addition, you will be provided with information and guidance in order to understand the importance of landfill gas utilization. Anyone working with a landfill gas system will benefit from this course.



Landfill and Landfill Gas Courses

LANDFILL GAS SYSTEM OPERATION

2-Day Course and 1-Day Workshop

Go "beyond basics" with this interactive workshop exploring the daily challenges associated with operations and maintenance of LFG systems. Share knowledge with your colleagues and learn new approaches for capturing, controlling, and managing landfill gas. This interactive session will be moderated by a SWANA faculty member, and is a great way to actively increase your knowledge of landfill gas systems.

TRAINING FOR SANITARY LANDFILL OPERATIONS PERSONNEL

1-Day Course

Through interactive classroom exercises, discussions and case studies, you will overview landfill operations and how they relate to one another in order to learn how to be more effective on the job. Instructors with in-depth experience in landfill operations will help you gain a better understanding of the fundamentals of groundwater movement, accident analysis and recognize the factors that contribute to leachate production. In addition, receive top of the line training on how sanitary landfills work as components of integrated solid waste management systems.

LANDFILL GAS PRIMER

Gain vital insight about gas regulations and become familiar with system design, construction and monitoring. In addition, you will be provided with information and guidance in order to understand the importance of landfill gas utilization. Anyone working with a landfill gas system will benefit from this course. As with all online E-Study Courses, you determine the pace and schedule of the course.

ECTC PRESENTS CONTROLLING EROSION & STORM WATER RUNOFF ON LANDFILL CAPS

Finish your landfill off with style with this new E-Course. In a partnership with the Erosion Control Technology Council (ECTC), SWANA is proud to present this new E-Course to help landfill owners create more presentable landfill caps through the use of Rolled Erosion Control Products (RECPs). Presented by a member of ECTC, this course will cover such topics as NPDES Regulations, an overview of RECPs, as well as the installation, design, and selection of RECPs.

Landfill and Landfill Gas Courses

For SWANA CEU information, see pages 27-28.

CONSTRUCTION WASTE & DEMOLITION DEBRIS RECYCLING... A PRIMER

An educational tool for communities and private sector interests, this document focuses on the planning issues and implementation opportunities associated with the recycling of construction waste and demolition debris. Lessons covered include regulatory climate, generation data, materials, market opportunities, and management systems to name a few. Keep the manual for future reference, so you'll always have this valuable information at your fingertips.

MANAGING LANDFILL GAS AT MUNICIPAL SOLID WASTE LANDFILLS

This course is perfect for those seeking guidance on the complex issue of landfill gas management. This course covers such topics as MSW landfill emission generation, composition, migrations and extraction components, as well as regulatory codes pertaining to RCRA and the Clean Air Act. As with all Home Study Courses, keep the manual for future reference!

LITTER MANAGEMENT AT MSW LANDFILLS

Are you blown away by the cost of litter at your landfill? Let SWANA help you clean up your act with Litter Management at MSW Landfills. Learn about the impact of litter and the importance of a good litter management program, as well as the sources and causes of litter. Learn about litter control techniques from one of the industry's top professionals from the comfort of your home or office.

LEACHATE GENERATION, COLLECTION AND TREATMENT AT MSW LANDFILLS

Learn about the common constituents that make up groundwater and biological treatment. Also get an understanding of the regulatory scope of RCRA Subtitle D in regards to groundwater monitoring, and become familiar with leachate recirculation methods. Keep the manual for future reference, so you'll always have this valuable information at your fingertips.

GROUNDWATER MONITORING, SAMPLING, ANALYSIS AND WELL CONSTRUCTION

This course provides MSW professionals with an understanding of monitoring groundwater within the scope of RCRA Subtitle D. Topics include design and construction of wells, monitoring programs, and corrective actions. As with all Home Study Courses, keep the manual for future reference!

Collection and Transfer Courses

For SWANA CEU information, see pages 27-28.

MANAGING TRANSFER STATION SYSTEMS

3-Day Certification Prep Course

Be a lean mean, transfer operations machine! As a prep course for the Transfer Systems Certification exam, anyone who is or would like to become a transfer station manager or consulting engineer will be provided with fundamental information on ways to effectively plan, design, and operate MSW transfer stations. Receive cutting edge training on how to run a MSW transfer station in the most successful way by experiencing a hands-on tour, a field exercise at a local transfer station facility and classroom taught exercises. In addition, learn about design objectives including capacity, selection of appropriate technology, structure considerations and site planning.

MANAGING MUNICIPAL SOLID WASTE COLLECTION SYSTEMS

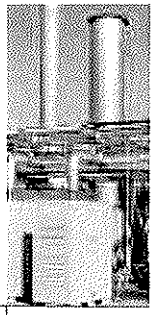
3-Day Certification Prep Course

Be able to handle waste with haste through this prep course for the Collection Systems Certification exam. Receive instruction in all the areas tested on the exam, such as an understanding of the logistics of planning, managing and operating solid waste and recyclables collection services. This course consists of presentations, classroom exercises and case studies that will enable you to navigate and chart routes more effectively. You will examine waste characteristics, service types, equipment, routing and system design. Furthermore, learn up-to-date practices for handling various materials, including residential MSW, traditional recyclables, yard wastes, bulky items and commercial wastes.

TRAINING FOR COLLECTION OPERATIONS PERSONNEL

1-Day Course

Save time and money on every route, every day! Individuals who are responsible for the collection of solid waste and recyclables from household and commercial establishments on a day-to-day basis can increase their knowledge of collection strategies. Be provided with what every collection operations personnel should know through interactive classroom exercises, discussions and case studies. Time is money, and this course will help you to acquire a higher understanding of routing in order to be cost-efficient. Furthermore, learn how to define a preventative maintenance program, go over the importance of effective sanitation practices, and obtain insight on important health and safety issues.



Collection and Transfer Courses

SWANA'S ON-LINE TRAINING COURSES

Why "waste" an opportunity to improve your safety performance? At SWANA, we recognize the importance of minimizing risk and developing an effective safety program for transfer station personnel. During this course, you will get an overview of OSHA and federal regulations. Also, you will discuss musculo-skeletal disorders and how to prevent ergonomic injuries. Upon completion, you will understand why it is essential to establish a transfer station health and safety program as well as learn to recognize unsafe practices of others. Earn valuable SWANA CEUs for a range of Certification Disciplines by participating in this extremely important course!

HEALTH AND SAFETY FOR TRANSFER STATION PERSONNEL

1-Day Course

Does it pain you to see the unsafe work habits of your collection personnel? Well let SWANA help you reduce those pains with our Health and Safety for Collections Personnel Course. This kit comes with everything a supervisor or manager needs to train their employees on proper techniques and precautions to reduce workplace injuries. Other topics covered in this course include loss control, and health and safety issues, as well as regulatory issues.

HEALTH AND SAFETY FOR COLLECTION PERSONNEL

Appendix B
Site Specific Training
Lesson Plan and Exam

Pre-Entry Briefing

Objective: The objective of this pre-entry briefing is to introduce visitors and first-day employees to the safety controls of the BRC CAMU. Attendees should understand where active portions of the site are, where emergency response equipment is located, site hazards (chemical, physical, biological), and general safety rules of the BRC CAMU.

Active Areas
Indicate on map:

- haul routes
- waste excavation (exclusion, contamination reduction, support zones, as appropriate)
- waste placement (exclusion, contamination reduction, support zones, as appropriate)

Emergency Response:

Contact Name

Phone number(s)

Hospital Location

Location of emergency equipment (fire extinguishers, alarms)

Meeting location(s)

First Aid steps: Check-Call-Care

Personal Protection Equipment

Hardhat – at all times

Steel Toe Boots – at all times

Eye protection – at all times

Hearing Protection – where applicable

Tyvek – where applicable

Gloves – where applicable

Respirator – where applicable

Basic Site Safety:

1. Keep your mind on your work at all times. No horseplay on the job. Injury or termination or both can be the result.

2. Personal safety equipment must be worn as prescribed for each job, such as: safety glasses for eye protection, hard hats at all times, gloves when handling materials, and safety shoes..

3. Watch where you are walking. Don't run.

4. Seat belts are required at all times when driving/operating.

5. The use of illegal drugs or alcohol or being under the influence of the same on the project shall be cause for your immediate termination. Inform your supervisor if taking strong prescription drugs that warn against driving or using machinery.

6. Do not distract the attention of fellow workers. Do no engage in any act that would endanger another employee.

7. Sanitation facilities are provided for your use. Defacing or damaging these facilities is forbidden.

8. Never move an injured person unless it is absolutely necessary. Further injury may result. Keep the injured as comfortable as possible and utilize job site first-aid equipment until an ambulance arrives.

9. Know where firefighting equipment is located and be trained on how to use it.

10. Nobody but operator shall be allowed to ride on equipment unless proper seating is provided.

11. Do not use power tools and equipment until you have been properly instructed in the safe work methods and become authorized to use them.

12. Do not enter an area that is barricaded or otherwise blocked from entry.

13. If you must work around trucks or heavy equipment, make sure operators can always see you and know that you are there. Barricades are required for cranes.

14. Never oil, lubricate, or fuel equipment while it is running or in motion. Do not perform these operations on equipment in areas not specifically designated for these operations.

15. Before servicing, repairing, or adjusting any powered tool or piece of equipment, disconnect it, lock out the source of power, and tag it out.

16. Barricade danger areas. Guard rails or perimeter cables may be required.

17. Trenches over five feet deep must be shored or sloped as required. Keep out of trenches or cuts that have not been properly shored or sloped. Excavated or other material shall not be stored nearer than two feet from the edge of the excavation. Excavations less than 5 ft may also require cave in protection.

18. Use the "four and one" rule when using a ladder. One foot of base for every four feet of height.

19. Know what emergency procedures have been established for your job site. (location of first aid kit, fire extinguisher locations, evacuation plan, etc.)

Hazard Analysis

Physical
Heat Stress
Excavation
Hand/Foot Injury
Heavy Equipment
Noise
Portable Power/Hand Tool
Slip/Trip/Fall

Chemical
Inhalation
Skin absorption
Fire
Reactivity

Biological
Insect/Vermin/Snake Bites

Exam

The pre-entry briefing exam will be taken at the conclusion of the meeting. A passing rate of 75% is required for access to the site. Incorrect answers will be explained and topics covered again.

Pre-entry Briefing Exam

Name:_____
I have read and understand the BRC CAMU Health and Safety Plan Yes No
Date:_____

Position:_____

1. What are the three emergency first aid steps?

   A. Stop-Look-Listen
   B. Call-Check-Care
   C. Check-Call-Care
   D. None of the Above

2. You are working near an excavator, what PPE do you need?

   A. Hardhat, boots, eye protection, hearing protection
   B. Boots, hardhat
   C. Hardhat, hearing protection
   D. None of the above

3. When excavating, at what depth is shoring required?

   A. 3 feet
   B. 1 foot
   C. 5 feet
   D. 2 feet

4. You are not 24-hour or 40-hour HAZWOPER certified, how close can you be to the excavation or waste placement activities?

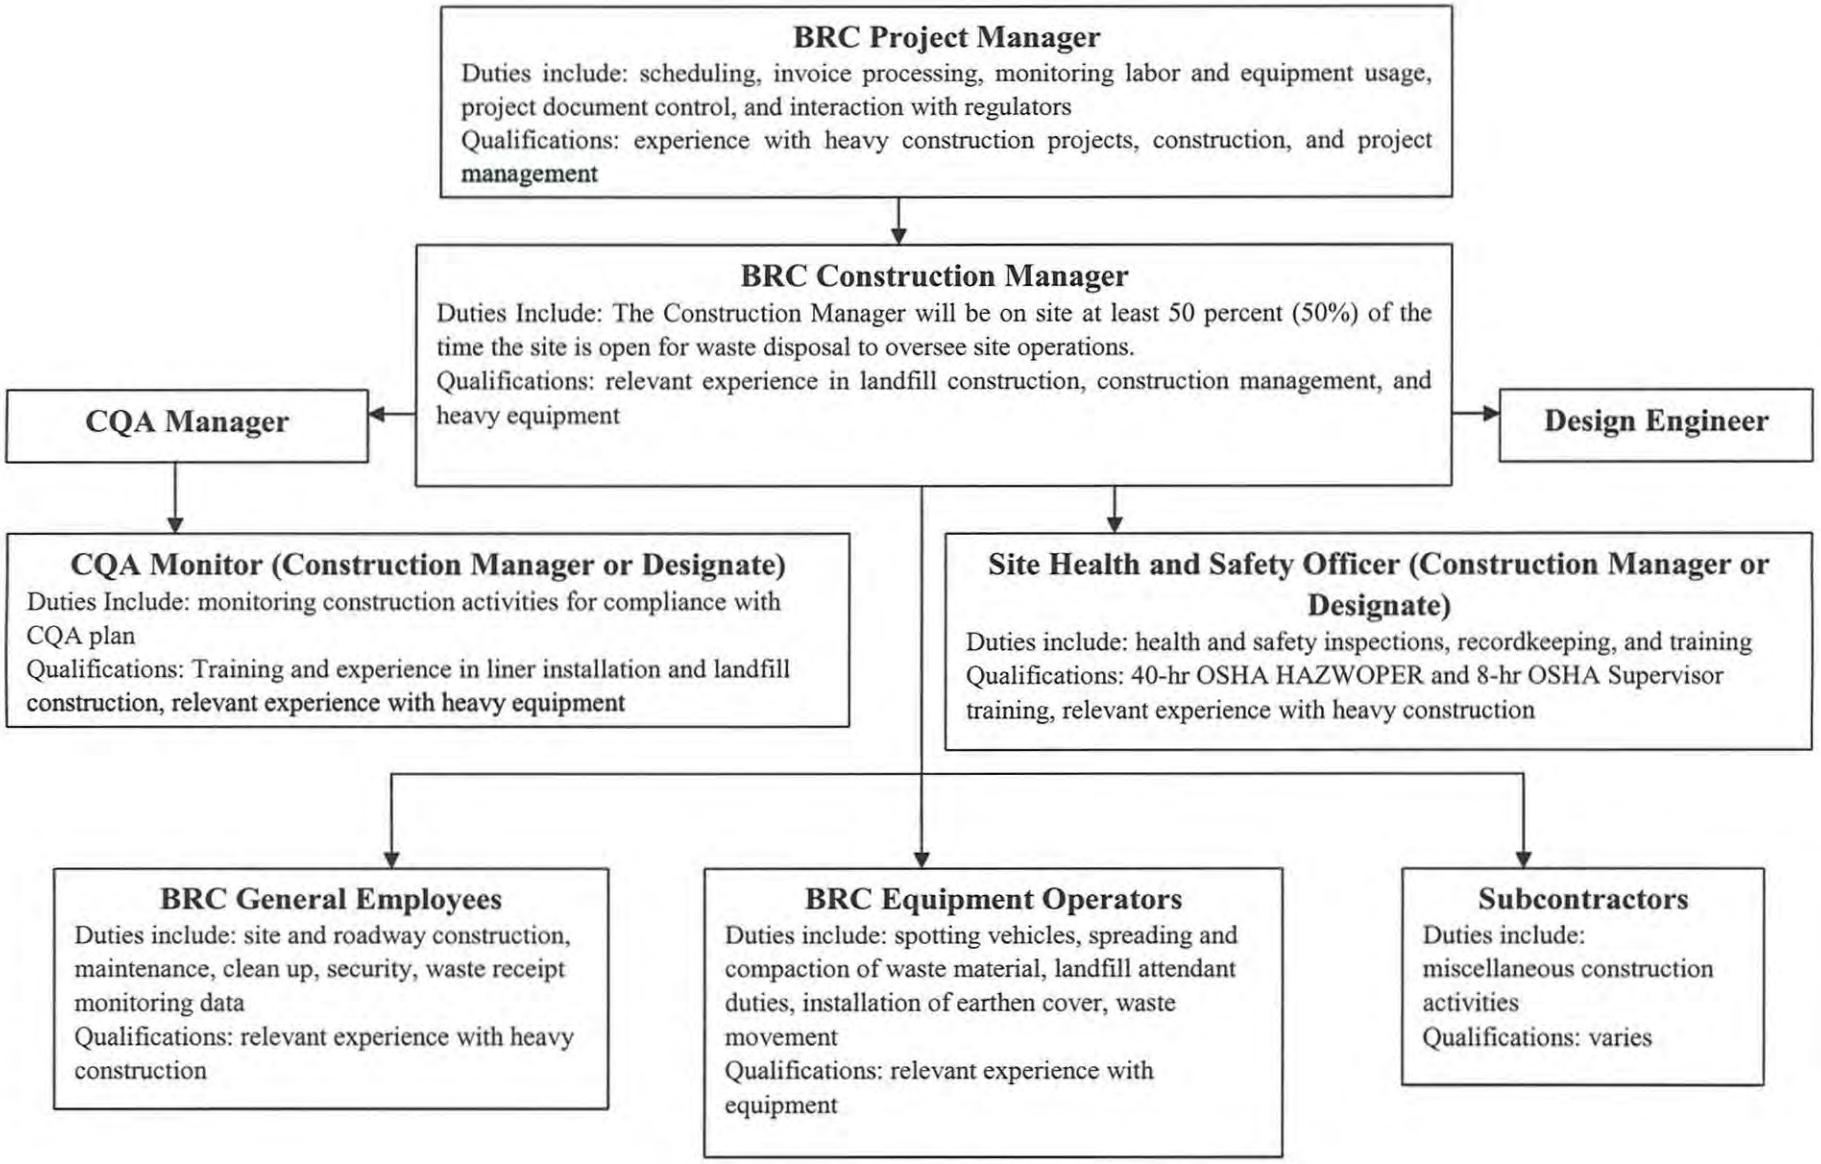
   A. Exclusion Zone
   B. Contamination Reduction Zone
   C. Support Zone
   D. None of the Above

5. What's the first step in an emergency?

   A. Call the Construction Manager
   B. Go to a safe location
   C. Go Home
   D. None of the above

Number Incorrect:_____ Pass / Fail Trainer's Name:_____

Appendix C
Organizational Flowchart



BRC Project Manager
Duties include: scheduling, invoice processing, monitoring labor and equipment usage, project document control, and interaction with regulators
Qualifications: experience with heavy construction projects, construction, and project management
BRC Construction Manager
Duties Include: The Construction Manager will be on site at least 50 percent (50%) of the time the site is open for waste disposal to oversee site operations.
Qualifications: relevant experience in landfill construction, construction management, and heavy equipment
CQA Manager
Design Engineer
CQA Monitor (Construction Manager or Designate)
Duties Include: monitoring construction activities for compliance with CQA plan
Qualifications: Training and experience in liner installation and landfill construction, relevant experience with heavy equipment
Site Health and Safety Officer (Construction Manager or Designate)
Duties include: health and safety inspections, recordkeeping, and training
Qualifications: 40-hr OSHA HAZWOPER and 8-hr OSHA Supervisor training, relevant experience with heavy construction
BRC General Employees
Duties include: site and roadway construction, maintenance, clean up, security, waste receipt monitoring data
Qualifications: relevant experience with heavy construction
BRC Equipment Operators
Duties include: spotting vehicles, spreading and compaction of waste material, landfill attendant duties, installation of earthen cover, waste movement
Qualifications: relevant experience with equipment
Subcontractors
Duties include: miscellaneous construction activities
Qualifications: varies

1.0 INTRODUCTION

This Accident Prevention, Contingency, and Emergency Response Plan describes the precautions taken to prevent accidental ignition or reaction of ignitable or reactive wastes, and precautions taken to prevent interaction of incompatible wastes. This plan also includes other procedures to minimize the possibility of, and hazards from, a fire, explosion, or unplanned sudden or non-sudden release of hazardous waste constituent to air, soil, or surface water. These procedures also address the proper design, construction, maintenance, and operating practices designed to reduce the potential for injury or other threats to human health or the environment.

1.1 Contaminants

Extensive testing of the waste material determined the majority of wastes to be non-hazardous. The following is a list of general contaminants found in the waste material to be placed in the CAMU:

- VOCs
- SVOCs
- PCBs
- Metals
- Pesticides

The waste materials are not incompatible, reactive, or ignitable. Additional waste characterization detail can be found in Attachment C, Waste Analysis Plan.

2.0 PREVENTION

2.1 Health and Safety Plan

The BRC CAMU will have an active Health and Safety program for workers at the BRC CAMU. Either the current BRC Health and Safety Plan (HASP) or a similar plan developed by the pertinent contractor will be used, periodically updated, and kept on site. A safety meeting will be held at least quarterly to review safety procedures and issues, or whenever operations change. Daily safety tailgate meetings will address health and safety issues of the day. Employees working at the BRC CAMU will attend. Personal safety equipment such as eye protection, steel-toed boots and hard hats will be required of all BRC CAMU non-office personnel. In case of personal injury, the field office will be notified immediately by two-way radio or cellular telephone and, if necessary, an ambulance summoned from the local hospital, St. Rose de Lima

approximately 1 ¼ miles from the BRC CAMU (Figure G-1), or the local (City of Henderson or Clark County) Fire Department.

2.2 Arrangements with Local Authorities

Prior to operation, the BRC CAMU Construction Manager will contact the Henderson Police and Fire Departments and the Clark County Sheriff and Fire Departments and their emergency response teams to make arrangements to familiarize them with the BRC CAMU. The BRC CAMU Construction Manager will provide details of the BRC CAMU including layout, properties of wastes handled and associated hazards, normal operating areas, entrances, and possible evacuation routes. In addition, the BRC CAMU Construction Manager will contact the St. Rose de Lima Hospital with the types of injuries or illnesses that could potentially occur at the BRC CAMU.

2.3 Personal Protective Equipment (PPE)

Level D PPE will be required at all times at the Site. Level D equipment required includes long pants, gloves, steel-toe boots, hard hats, safety glasses, and hearing protection (when appropriate).

2.4 Exposure Assessment and Air Monitoring

Dust monitoring will be conducted during the construction activities. The objectives are to monitor working conditions and to assess potential fugitive dust migration at the Site perimeter. MIE® DATA RAM air particulate monitors, or similar, will be set up at four dust monitoring stations during field activities to record total levels of dust. Air monitoring stations will be positioned with one station located upwind at the Site perimeter, two stations downwind at the Site perimeter, and one station in the workers' breathing zone. In addition, GilAir 5® air sampling pumps, or similar, will be placed at each dust monitoring station, with filter cassettes changed daily. Filter cassettes will be sent to a laboratory for analysis.

Frequency of air monitoring readings will be adjusted on site accordingly, with the consent of the Site Health and Safety Officer (SHSO and Project Manager). Equipment will be calibrated before work begins each day and at the end of the day. Air monitoring readings and calibration records will be documented in the Field Logbook.

2.5 Activity Hazard Analysis

The chemical, physical, and biological hazards are discussed in detail in the Site HASP for each activity performed on-site.

2.6 Personnel Training

Employees assisting in construction activities within the exclusion zone will have Occupational Safety and Health Administration (OSHA) 40-hr Hazardous Waste Operations and Emergency Response Standards (HAZWOPER) certification. In addition, the BRC CAMU Construction Manager will have 8-hr OSHA Site Supervisor training. The CAMU Construction Manager will be required to provide health and safety "tail gate" meetings for new workers and visitors. Employees are responsible for knowing the site chemical, biological, and physical hazards as well as how to prevent accidental release of wastes.

2.7 Site Map

A site map will be maintained on site. The site map will be regularly updated to show the exclusion zone, decontamination zone, and support zone as they change throughout BRC CAMU construction. The site map shall be posted in the work area and will include the following information:

- General Wind Direction
- Evacuation Routes
- Refuge Locations
- Route to St. Rose de Lima Hospital and First Aid Medical Assistance (may be provided on separate map)
- Boundaries of Exclusion Zone (as described below)
- Boundaries of Contamination Reduction Zone (as described below)
- Boundaries of Support Zone (as described below)

Changes will be made to the site map by the SHSO, as needed, based on site conditions.

2.7.1 Work Zones

Three work zones will be established for each task. The Exclusion Zone is defined as the area on-site where contamination is suspected and tasks are to be performed. The Contamination Reduction Zone (CRZ) is defined as the area where equipment and workers are to be decontaminated. The Support Zone is defined as the command area and also serves as a storage area for supplies. The exact location and extent of the work zones will be modified as necessary.

2.8 Site Access

Access to the site will be controlled using a sign-in/sign-out log.

2.9 Visitors

Visitors to the site will be continually escorted in order to assure their safety since they may be unfamiliar with the site. Visitors will not be allowed past the Support Zone unless they read, understand, sign, and meet the requirements outlined in the Site HASP.

2.10 Communications

On-site communications will be conducted through the use of the following:

- Verbal
- Two-way radio
- Horn
- Mobile telephone
- Siren
- Hand signals

Off-site communications will be conducted through the use of mobile telephones.

2.11 Safe Work Practices

General Safe Work Practices that will be implemented during work activities at this site are:

- Minimization of contact with waste materials.

- Smoking, eating, or drinking after entering the work zone and before decontamination will not be allowed. Employees who are suspected of being under the influence of illegal drugs or alcohol will be removed from the site. Workers taking prescribed medication that may cause drowsiness will not be permitted to operate heavy equipment, and will be prohibited from performing tasks where Level C, B, or A PPE is required.
- Good housekeeping will be practiced.
- Use of contact lenses on-site will not be allowed when dictated by working conditions.
- The following conditions will be observed when operating a motor vehicle.
  - Wearing of seat belts is mandatory
  - During periods of rain, fog, or other adverse weather conditions, the use of headlights is mandatory
  - A backup warning system or use of vehicle horn is mandatory when the vehicle is engaged in a backward motion
  - All posted traffic signs and directions from flagmen will be observed
  - Equipment and/or samples transported in vehicles will be secured from movement
- In an unknown situation, the worst conditions will always be assumed.
- Conflicting situations may arise concerning safety requirements and working conditions and will be addressed and resolved rapidly by the BRC CAMU Construction Manager to relieve any motivations or pressures to circumvent established safety policies.
- Breaches of specified safety protocol will not be allowed.

2.12 Inspections

The BRC CAMU Construction Manager will conduct weekly health and safety inspections. The inspections will be documented using the Inspection checklist included with Attachment E. The Weekly Health & Safety Inspection Checklist will be kept on file at the project site.

2.13 Decontamination

PPE will be decontaminated as per 29 CFR §1910.120(k). The decontamination procedures, equipment and decontamination solution required for each task will be included in the Site Health and Safety Plan. In an emergency, the primary concern is to prevent the loss of life or severe injury to site personnel. If immediate medical

treatment is required to save a life, decontamination will be delayed until the victim is stabilized. If decontamination can be performed without interfering with essential life-saving measures or first aid, or if worker has been contaminated with an extremely toxic or corrosive material that could cause severe injury or loss of life, decontamination will be performed in coordination with or prior to initial medical treatment at the scene.

3.0 CONTINGENCY AND EMERGENCY RESPONSE PLAN

3.1 Fire Control

Fire extinguishers will be on hand to put out small fires near the working area, in the remote possibility they may occur. In the event of a significant fire emergency, the Henderson Fire Department will be notified immediately and the emergency will be reported.

3.2 Shut Down Procedures

In the event the BRC CAMU needs to be shut down, a detailed procedure list will be available at the site in the contingency plan. Step-by-step procedures will be detailed, including maps showing pertinent locations of systems.

3.3 Hazardous or Toxic Materials Release

A Hazardous Materials Emergency Plan will be prepared. It will mainly focus on those chemicals and materials associated with vehicle fueling and maintenance. Because the waste material being disposed of in the BRC CAMU is from a known source area, the likelihood of hazardous or toxic material release resulting from the waste materials is minimal.

3.4 Emergency Procedures

The following steps will be followed when there is an emergency:

1. The BRC CAMU Construction Manager, or alternate, will be immediately notified. The BRC CAMU Construction Manager assumes control of the emergency response.
2. As necessary, off-site emergency responders (e.g., fire department, hospital, police department, etc.) will be notified as to the nature and

location of the emergency on site. Please see Table G-1 for contact information.

3. If applicable, the BRC CAMU Construction Manager evacuates the site. Site workers will move to their respective refuge stations using the evacuation routes provided on the Site Map.
4. BRC CAMU Construction Manager will assess possible hazards to human health or the environment resulting from the emergency and shall contact the appropriate authorities for the Henderson, Nevada area or the National Response Center (toll free: (800) 424-8802). The report will include:
    a. Name and telephone number of the reporter;
    b. Name and address of the BRC CAMU;
    c. Time and type of incident;
    d. Name and quantity of material(s) involved, to the extent known;
    e. The extent of injuries, if any; and
    f. The possible hazards to human health, or the environment, outside the facility.
5. For small fires, flames will be extinguished using the fire extinguisher. Large fires will be handled by the fire department.
6. In an unknown situation or if responding to toxic gas emergencies, appropriate PPE, including SCBAs, will be donned.
7. If chemicals are accidentally spilled or splashed into eyes or on skin, safety eyewash and/or shower will be used.
8. Before continuing site operations, after an emergency involving toxic gas, the BRC CAMU Construction Manager will don a SCBA and utilize appropriate air monitoring equipment to verify that the site is safe.
9. An injured worker shall be decontaminated appropriately.
10. If a worker is injured, first aid will be administered by workers certified in first aid.

3.5 Reporting

The BRC CAMU Construction Manager will note in the operating record the time, date, and details of any incident that requires implementing this plan. The report will be submitted to the NDEP and include:

a. Name, address, and telephone number of the owner or operator;
b. Name, address, and telephone number of the facility;
c. Date, time, and type of incident;

d. Name and quantity of material(s) involved;
e. The extent of injuries, if any;
f. An assessment of actual or potential hazards to human health or the environment, where applicable; and
g. The estimated quantity and disposition of recovered material that resulted from the incident.

Incident reports will be kept as part of the operational records and maintained by BRC for at least 3 years and otherwise in accordance with the records retention provision of the AOC3.

Copies of Letters Sent to Police, Fire, and Hospital Emergency Contacts

Basic Remediation
COMPANY

February 20, 2007

Mr. Val Baciarelli
President
St. Rose Dominican Hospital-Rose de Lima
102 East Lake Mead Parkway
Henderson, Nevada 89015

Dear Mr. Baciarelli,

As you may know, work will soon commence on the clean-up and restoration of the 2200 acre tract owned by our affiliate, the LandWell Company, that is bounded on the south by Lake Mead Parkway, on the west by Boulder Highway, and on the north by the Las Vegas Wash. This clean-up and restoration is being conducted under the jurisdiction and supervision of the Nevada Division of Environmental Protection, with significant input from the City of Henderson and Clark County. As part of this project, we have developed Accident Prevention, Contingency, and Emergency Response Plans. These plans provide for fire, police, and medical responses, if needed. We have designated the St. Rose Dominican Hospital as primary responder in the event of injury. While we do not expect problems to arise that would require a response by the Hospital's emergency room, we want to be prepared for such a contingency. If you would like a more detailed briefing in person on details of the clean-up and restoration project, I would be happy to provide this. I can be contacted at 702-567-0400 and at sahuron@earthlink.net.

Sincerely,

Ron Sahu, Ph.D., CEM
Project Manager

875 West Warm Springs, Henderson, Nevada 89015 • Phone 702.567.0400 • Fax 702.567.0473

Basic Remediation
COMPANY

February 20, 2007

Mr. Richard D. Perkins
Chief of Police
Henderson Police Department
223 Lead Street
Henderson, Nevada 89015

Dear Chief Perkins,

As you may know, work will soon commence on the clean-up and restoration of the 2200 acre tract owned by our affiliate, the LandWell Company, that is bounded on the south by Lake Mead Parkway, on the west by Boulder Highway, and on the north by the Las Vegas Wash. This clean-up and restoration is being conducted under the jurisdiction and supervision of the Nevada Division of Environmental Protection, with significant input from the City of Henderson and Clark County. As part of this project, we have developed Accident Prevention, Contingency, and Emergency Response Plans. These plans provide for fire, police, and medical responses, if needed. We have designated the Henderson Police Department as primary responder in the event of theft or assault. While we do not expect problems to arise that would require a response by the Police Department, we want to be prepared for such a contingency. If you would like a more detailed briefing in person on details of the clean-up and restoration project, I would be happy to provide this. I can be contacted at 702-567-0400 and at sahuron@earthlink.net.

Sincerely,

Ron Sahu, Ph.D., CEM

1.0 INTRODUCTION

The BRC CAMU emergency coordinator is completely familiar with the site operation and Accident Prevention, Contingency, and Emergency Response Plan. In addition, the emergency coordinator must be familiar with all activities at the facility, the location and characteristics of waste handled, the location of all records within the facility, and the layout. The emergency coordinator is responsible for directing the emergency procedures outlined in Attachment G. He or she shall have successfully completed all training and is responsible for the training records of all personnel outlined in Attachment G. The contact information for two additional individuals is also provided who can also fulfill this role. At least one individual shall be within 30 minutes of the BRC CAMU until closure.

1.0 INTRODUCTION

This attachment describes the geological, hydrogeological, and climatic conditions at the BRC CAMU. In addition, location standards and siting requirements for the proposed BRC CAMU are discussed.

2.0 GEOLOGIC CONDITIONS

This section summarizes the geological conditions present at the BRC CAMU site. The Draft Conceptual Site Model (CSM) for the Common Areas prepared by Daniel B. Stevens & Associates (DBS&A, 2006) provides greater detail about the geological and hydrogeological conditions at the site.

2.1 Geology

Regional Geology in Southern Nevada is the Basin and Range Province morphology of the Western Cordillera of North America. In this region, Cenozoic tectonic extension has resulted it a system of fault-bounded mountains separated by sediment-filled valleys. The basins consist of down-dropped blocks of crust while the ranges are upthrust slabs with a regional tilt to the east. The typical arrangement in the Basin and Range system is a valley bounded on each side by a normal fault running parallel to the range (DBS&A, 2006).

The BRC CAMU site is located in the Las Vegas Valley, a northwest-southeast trending basin within the Basin and Range Province. The predominate range influencing the BRC CAMU site conditions is the McCullough Mountains bounding the valley to the south (DBS&A, 2006).

Valley fill in the vicinity of the BRC CAMU site consists of Tertiary Muddy Creek Formation (TMCf) and overlying Quaternary Alluvium (Qa) associated with alluvial fan deposits shed from the McCullough Range Mountains. The Qa is the present-day land surface at the CAMU as well as in most of the Henderson area and has an average thickness of 50 to 60 feet. The Qa is predominantly sands and gravels classified as poorly graded gravels (GP), silty gravels (GM), well-graded sands (SW), poorly graded sands (SP), and silty sands (SM) in accordance with the Common Unified Soil Classification System (USCS) (DBS&A, 2006).

Beneath the BRC CAMU site, the boundary between the Qa and TMCf is an unconformity that represents a period of time when the TMCf strata was likely exposed to weathering and erosion. Erosion by streams originating in the McCullough Mountains cut into the TMCf resulting in paleochannels that were later filled by Qa. Two paleochannels have been inferred in the vicinity of the CAMU site: one paleochannel

from the south-central area to the northwest corner and a second paleochannel from the northeast corner of the CAMU site trending almost due north (DBS&A, 2006).

Beneath the Qa is lies the TMCf consisting of predominantly fine-grained sandy silts and clayey silts. Layers with increasing sand content are encountered. With the increasing distance east and north from the McCullough Range, the proportion of coarse-grained sediments in the upper portion of the TMCf appears to decrease. The total thickness of the TMCf is unknown with measurements varying from 2,158 feet to 3,050 (DBS&A, 2006).

2.2 Hydrogeology

Groundwater flow beneath the BRC CAMU site is generally to the north, northeast. Groundwater ranges from approximately 1725 ft Mean Sea Level (MSL) to 1695 ft MSL from the southern to northern areas of the BRC CAMU (Figure C7). The groundwater flow is approximately parallel to the slope of the land surface. The average gradient of the water table ranges from about 0.02 to 0.04 ft/ft with a hydraulic conductivity typically ranging from a few inches to up to 33 feet per day (ft/d). The Qa is unsaturated towards the east, with saturation first noted in the uppermost TMCf, near the contact between the Qa and the TMCf. The groundwater treatment system located on the eastern property adjacent to the CAMU is thought to have dewatered the Qa (DBS&A, 2006).

Groundwater quality in the Qa is poor. General water quality analysis performed on a groundwater sample collected from Kerr-McGee monitoring well M-10, which is installed upgradient of the BMI Complex, reported relatively high concentrations of total dissolved solids (2,680 mg/L), chloride (732 mg/L), and sulfate (857 mg/L) (ERM-West Inc., 1996).

Beneath the Qa, within the TMCf, groundwater exists generally under confined conditions in saturated coarser-grained lenses. Water in wells screened in the upper portion of the TMCf rose under the confining pressure to elevations within the Qa indicating an upward flux gradient from the TMCf into the overlying alluvium. The hydraulic conductivity in the TMCf was approximately 12 ft/d (DBS&A, 2006).

Recharge to the Qa due to precipitation is generally considered to be negligible but has increased in recent years due to increasing irrigation infiltration, sewage treatment plant effluent, and from the removal of phreatophytic vegetation near the washes (Geraghty & Miller, 1993). Natural discharge from the Qa is primarily due to springs, direct evaporation, and evapotranspiration, with little or no water discharging to the Las Vegas Wash (Geraghty & Miller, 1993, after USBR, 1982).

3.0 CLIMATE

The Las Vegas Valley is one of the driest and warmest areas in the nation. The climate consists of hot summers, and cool winters. Summer temperatures above 105° Fahrenheit (F) and winter temperatures below freezing are common. The average daily minimum and maximum temperatures during winter months are about 35° and 60° F. During summer nights, minimum temperatures average 70° to 75° F. The frost-free period averages about 241 days per year (Geraghty & Miller, 1993, after USBR, 1982).

The Las Vegas Valley is characterized by low annual rainfall, approximately 4.5 inches per year, that fall during two rainy seasons. During the winter, the rainfall is generally low-intensity and falls over a wide area. In the spring and fall, local thunderstorms subject the area to high-intensity rains of short duration, which can cause high-runoff conditions. Maximum rainfall within a 24-hour period for a 25-year storm is approximately 2.3 inches (NOAA Atlas 2, undated) in the site area.

Evaporation is high in the Las Vegas Valley, influenced by high temperatures, high winds, and low humidity (average 20%). Pan evaporation data form the period of 1985 through 1988 range from approximately 2.5 inches/month to more than 17 inches/month (ERM-West, Inc., 1996, after Law Engineering, 1993). The months with the highest evaporation (May through September) correspond to the times of high-intensity rainfall, which indicates that rainfall does not contribute significantly to the recharge of groundwater in this area (ERM-West, 1996). Measurements of evaporation at Boulder City and Lake Mead indicate an annual loss of about 6.5 feet of water, three-fourths of which occurs during the six warmer months. The evapotranspiration within Las Vegas Wash is expected to be significantly higher due to high consumptive use by cattails, warmer temperatures, and lower humidity (Geraghty & Miller, 1993, after USBR, 1982).

Winds are typically out of the southwest or northwest and average nine miles per hour (mph). Gusts greater than 50 mph occur several times a year during the massage of major frontal systems. Topography influences the wind flow patterns.

4.0 LOCATION RESTRICTIONS

4.1 Flood Plains

The proposed BRC CAMU is located in an area determined to be outside the 100-year flood plain (Figure I-1) (FEMA, 2002).

4.2 Fault Areas

The proposed BRC CAMU is not located within 200 feet of a fault that has had displacement in Holocene time. Two north-trending fault scarps are located approximately ½ mile northwest and southwest of the proposed BRC CAMU (Figure I-2) (Converse Consultants, 1999). Displacement on both faults is recorded as pre-Holocene.

4.3 Seismic Impact Zones

The proposed BRC CAMU is located in a seismic impact zone (USGS, 1982). The site is located in an area with a 10 percent or greater probability that the maximum horizontal acceleration in lithified earth material will exceed 10 percent of the earth's gravitational pull in 250 years (USGS, 1982). The maximum horizontal acceleration depicted on the seismic hazard map with a 90 percent or greater probability that the acceleration will not be exceeded in 250 years is 14 percent of the earth's gravity. The peak horizontal ground acceleration recommended for the design of the project is 0.15g (Converse Consultants, 1999). A soil profile type of S_D per Table 16-J of the 1997 Uniform Building Code is recommended for the site.

Structures for containment, including liners, systems for the collection of leachate and systems for the control of surface water, will be designed to resist the maximum horizontal acceleration in lithified earth material for the site. Proof of meeting these design requirements will be placed in the operating records for the site and the solid waste management authority will be notified that the proof has been placed in the operating records.

4.4 Unstable Areas

Portions of the land on which the North Mesa will be constructed have been historically used for waste disposal – namely, the slit trenches. Wastes, consisting of various industrial wastes, construction and demolition debris, and office trash was disposed of in "slit trenches" that were excavated below grade. The Draft Conceptual Site Model prepared by DBS&A details the recent investigation of the "slit trenches" revealing the depth and extent of waste material (DBS&A, 2006). The waste was placed in the trenches without compaction effort and covered with previously excavated native material. There is also evidence that some waste may have been ignited and burned. As a result of the waste being placed without compaction, the "slit trenches" have experienced settlement over the years.

As noted above, the BRC CAMU is sited to overlay the slit trench area, and this overlay will in itself protect the slit trenches from erosion by wind and water. However, the potential for continued settlement of the "slit trenches" may cause instability of the

BRC CAMU liner system, if not addressed. Therefore, engineering measures will be incorporated into the structural design of the BRC CAMU to consolidate (compact) these materials prior to construction of the overlying BRC CAMU liner system. These measures are more particularly specified in Attachment J, CAMU Design- Conceptual.

In addition, it should be noted that BRC expects to excavate certain portions of the slit trenches, based on a Slit Trench Remedial Alternative Study (Slit Trench RAS), which is in preparation. The goal is to remove waste materials in "hot spot" areas within the slit trenches on a preventive basis and to meet regulatory requirements. Locations so excavated will be properly backfilled and consolidated prior to construction of the CAMU.

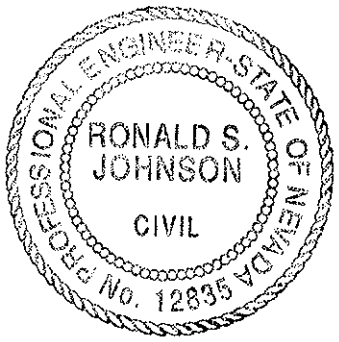
CONCEPTUAL DESIGN FOR
THE CONSTRUCTION OF
THE BASIC REMEDIATION COMPANY
CORRECTIVE ACTION MANAGEMENT UNIT

HENDERSON, NEVADA

The Engineering material and data contained in this Conceptual Design Plan were prepared under the supervision and direction of the undersigned, whose seal as a registered Professional Engineer is affixed below.

The Engineering system in this conceptual design will prevent the migration of any hazardous constituents into the ground water or surface water at least as effectively as the liner and leachate collection and removal system specified in 40 CFR 264.301(c).

Ronald Johnson, P.E.
Nevada No. 12835



1.0 INTRODUCTION

This conceptual design is prepared in accordance with 40 CFR Parts 264, 266 and 268. The technical approaches discussed in this section are intended to outline the key conceptual design features and components of the proposed landfill. Upon regulatory review and approval, the conceptual design will be refined to provide detailed specifications to meet the design standards and performance criteria outlined in this permit.

1.1 Maps and Plans

A series of maps, plans and cross-sections referenced throughout this section is located in Section 1 of the Supplemental RAP Information (SRAPI). The design plans include the following:

- Figure J-1 – Title Sheet and Drawing List (includes general location map).
- Figure J-2 – Legend, Abbreviations, and General Notes;
- Figure J-3 – Overall Site Plan;
- Figure J-4 – Construction Sequence Plan;
- Figure J-5 – Surcharge Plan;
- Figure J-6 – Site Preparation Plan;
- Figure J-7 – Construction Grading Plan;
- Figure J-8 – Storm Drain Plan;
- Figure J-9 – Final Cover Grading Plan;
- Figure J-10 – Cross Sections
- Figure J-11 – Final Cover and Liner Details and Sections;
- Figure J-12 – Fence Plan.

1.2 Anticipated Waste Material

The source materials for the proposed BRC CAMU include approximately 3.5 million cubic yards of residual solids (i.e., sediments and associated soils) from the industrial ponds, ditches, and other sources areas within the BMI Common Areas known as the Eastside Area. Extensive testing of the waste material has determined the majority of wastes to be non-hazardous. Volatile Organic Compounds (VOCs), Semi-volatile Organic Compounds (SVOCs), and Polychlorinated Biphenyls (PCBs) were detected sporadically, with VOCs and SVOCs throughout the site and PCBs in the Beta Ditch and first eight Upper Pond rows. Pesticides, metals, and cyanide were detected at low levels in the Beta Ditch and first eight Upper Pond rows. Asbestos was tested at measureable levels in the Beta Ditch and first eight Upper Pond rows. These wastes are not incompatible, reactive, or ignitable. Additional waste characterization detail can be found

in the Waste Analysis Plan (Attachment C). No wastes will be accepted from other sources.

Unlike typical landfills, both the source material and the proposed BRC CAMU will be under sole control of BRC. Consequently, there will be direct control over the types of waste materials placed at the BRC CAMU. Physical and chemical descriptions of the anticipated waste materials are presented in the Waste Analysis Plan (Attachment C).

1.2.1 Predicted Leachate Generation

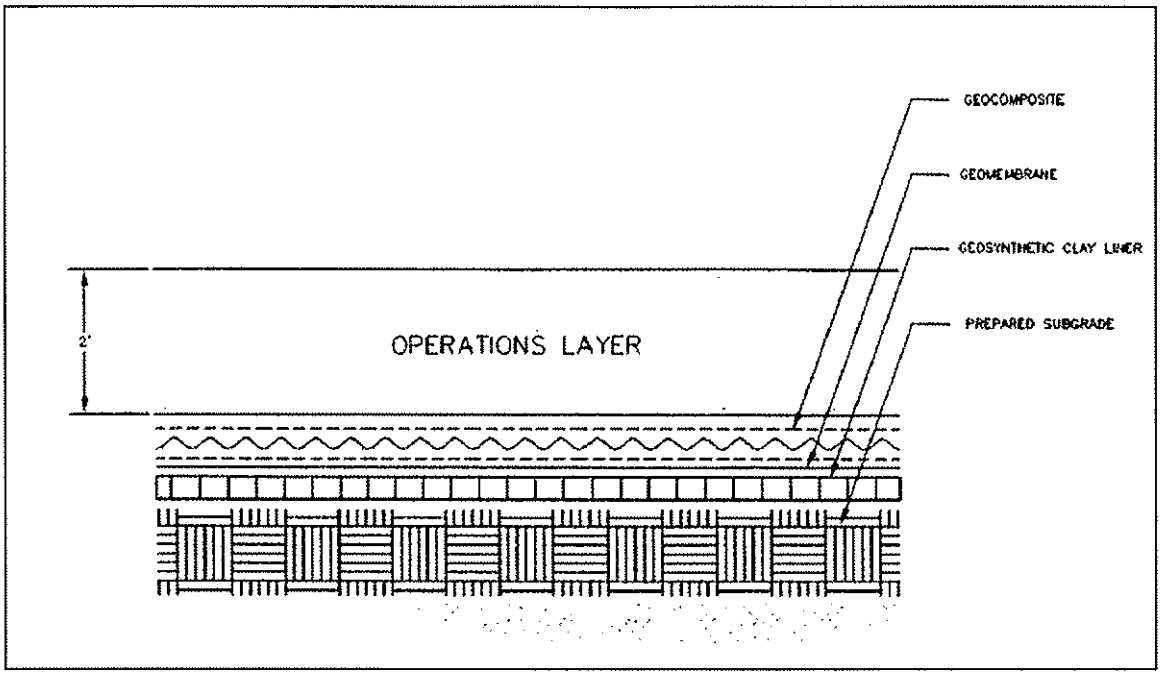
In the case of the proposed BRC CAMU, the mass of waste material will be compacted in place to form a hard-packed, monolithic "block," through which little or no saturated flow is expected to occur. Achieving the most favorable hydraulic conductivity in the compacted sediments depends on the degree of compaction, compaction method, type of soil, soil moisture content, and *in-situ* density. Wet waste sediments from the TIMET ponds will be mixed with dry solids, or otherwise dewatered, and then transported and placed to maintain a moisture content below that which is capable of generating leachate. The process will be designed such that waste sediments placed in the landfill meet the density and moisture content requirements that will in turn reduce leachate generation.

While waste material placed within the landfill will not be intrinsically capable of generating leachate, the ability for the landfill to produce leachate will be dependent on the quantity of the water allowed to infiltrate the interim and final cover materials and penetrate into the underlying waste materials. Therefore, final cover design and operational specifications for interim covers are important for the landfill system to provide for protection of the waters of the state. For this reason, the proposed interim and final cover are designed to reduce infiltration of water as described in Attachment O (Closure and Post-Closure Plan) and Attachment P (Final Cover Design).

2.0 LINER DESIGN

2.1 Liner and Leachate Collection System

A composite liner and leachate collection system is proposed as shown in cross-sections in Detail J-1 below. The composite liner will underlie the waste materials, providing a barrier to the underlying native soils and groundwater. Although leachate generation is not anticipated, this liner system is designed with a leachate collection system to reduce potential liquid accumulation at the base of the waste materials. Liner and leachate collection components will be constructed of materials having appropriate strength and chemical compatibility.



Detail J- 1, Composite Liner Layout

As shown in Detail J-1 above, the liner system is anticipated to consist of the following elements, or layers, from top to bottom: a geocomposite drainage layer, a geomembrane, and a geosynthetic clay liner (GCL). GCLs consist of a layer of bentonite-clay-backed geotextile. GCLs exhibit properties of low permeability soil liners, and have successfully substituted for the soil component in composite liner designs. Placement of a GCL under the geomembrane is commonly employed to increase effectiveness of the composite liner by limiting flow through potential flaws or pinholes in the geomembrane.

Geomembranes are relatively thin sheets of flexible polymeric materials that are manufactured and prefabricated at a factory and transported to the site. Because of their inherent impermeability, use of geomembranes in landfill construction is typically standard in the industry. Geomembranes are made of one or more polymers along with a variety of other ingredients such as carbon black, pigments, fillers, plasticizers, processing aids, crosslinking chemicals, anti-degradants, and biocides. The polymers used to manufacture geomembranes include a wide range of plastics differing in properties such as chemical resistance and basic composition. The polymeric materials may be categorized as follows:

- Thermoplastics such as polyvinyl chloride (PVC);

- Crystalline thermoplastics such as high density polyethylene (HDPE), low density polyethylene (LDPE), and linear low density polyethylene (LLDPE); and

- Thermoplastic elastomers such as chlorosulfonated polyethylene (CSPE).

The polymeric materials used most frequently as geomembranes are HDPE, PVC, and CSPE. Geomembrane thickness range from 20 to 120 mil (1 mil = 0.001 inch). The recommended minimum thickness for all geomembranes is 30 mil, with the exception of HDPE, which must be at least 60 mil. A 60-mil HDPE geomembrane is proposed for the BRC CAMU, which is widely recognized in the industry as a very chemically resistant, durable, long-lasting material.

Geocomposite is to be placed on the geomembrane to protect it from puncture by the overlying operations layer soil. The geocomposite is designed to allow leachate, if generated by the waste materials, to flow toward perforated HDPE collection piping and be collected at the pump-out locations. The base grade of the landfill is engineered to slope toward these leachate collection areas.

Components of the leachate collection system (LCS) will have sufficient strength to support overlying compressive stresses. Pipe strength calculations will include resistance to wall crushing, pipe deflection, and buckling pressure. Perforated drainage pipes have been shown to provide good long-term performance in LCSs (USEPA, 1993).

Geotextile filter is a component of the geocomposite that will reduce physical clogging of the drainage layer from the overlying fine-grained material.

The liner system is intended to work together with other design components to isolate the waste materials from the environment. The main objective of BRC CAMU design is to provide a design that protects waters of the state. Design components that are intended to accomplish this objective are as follows:

1. The final cover, or cap, of the landfill is designed to allow essentially no infiltration of water into the waste materials. The final cover is described in the CAMU (Landfill) Closure and Post Closure Plan (Attachment O).

2. The waste material will be compacted to the degree necessary to reduce saturated flow within the interred materials. As discussed earlier, material from the TIMET ponds will be mixed with dry soils or dewatered, as necessary, prior to interment in the BRC CAMU. Together with a cap that reduces infiltration in an arid environment, the resulting potential for contaminant mobilization and leachate generation is considered minimal.

3. In addition to the above precautions, the underlying liner system will be designed to collect leachate generated, thereby providing an additional factor of safety in reducing waste migration into the groundwater.

4. The base of the landfill will be at least 5 feet higher than first groundwater at the groundwater's highest elevation, providing a buffer between groundwater and the landfill (Section 9 of the Supplemental Rap Information [SRAPI]).

Engineering design calculations and construction specifications for the base liner system and leachate collection system are presented with the Supplemental RAP Information (SRAPI), Sections 2 and 4, respectively. A summary is provided in the following section.

3.0 SUMMARY OF ENGINEERING ANALYSIS

3.1 General

This section summarizes the results of the conceptual design calculations performed for the base liner system at the BRC CAMU Landfill site. The following calculations were performed:

- Slope Stability Evaluation - Cut Slopes (Calculation Package A);
- Slope Stability Evaluation - Final Waste Slopes (Calculation Package B);
- Drainage Pipe Size Calculations (Calculation Package C);
- Pipe Strength Calculations (Calculation Package D);
- Veneer Stability Calculations (Calculation Package E);
- Geotextile Separation/Filtration Calculations (Calculation Package F);
- Geotextile Puncture Protection Calculations (Calculation Package G);
- Sump Capacity Calculations (Calculation Package H);
- Comparison of Flow Through the Prescriptive Composite Liner and a Proposed Alternative Composite Liner (Calculation Package I);
- Tension Due to Wind Uplift (Calculation Package J);
- Evaluation of Liner System Anchor Capacity (Calculation Package K);
- Drainage Geocomposite Equivalency Demonstration (Calculation Package L); and
- Consolidation Analyses (Calculation Packages M and N)

The base liner system calculations are based on the conceptual design grading plans shown on Figures J-7 and J-9 Additional calculations may have to be performed if there are changes to elevation and grade in the aforementioned design grading plans.

3.2 Slope Stability Evaluation

3.2.1 General

This section summarizes the analyses performed for the cut slopes and the final waste slopes. The analyses summarized herein are for static stability. Seismic site response, stability, and permanent deformation analyses are presented in Attachment O.

3.2.2 Cut Slopes

Slope stability was evaluated for the proposed cut slopes for the BRC CAMU. One cross-section was analyzed that represents the most critical case. Cut slopes with the highest height, weakest materials, and/or steepest slope are chosen for this analysis. The analyzed native soil cut slope has a height of approximately 44 ft and a base sloping at 3%. The proposed native soil cut slopes are at a slope angle of 2.1:1 (horizontal:vertical). The material properties selected and used in these analyses were based on a preliminary investigation by Converse Consultants, Inc. [Converse, 1999]. The calculations suggest that the most critical potential failure surface of the 2.1H:1V native soil cut slope possesses a factor of safety of approximately 1.5. Since the native soil cut slopes are considered interim, seismic evaluations were not conducted. Native soil cut slope stability calculations are presented in Section 2, Calculation Package A of the SRAPI.

3.2.3 Final Waste Slopes

The stability of the final waste slopes for the BRC CAMU was analyzed. Two cross-sections were analyzed that represent the most critical cases. Similar to cut slope analysis, waste slopes with the highest height, weakest materials, and/or steepest slope are chosen for this analysis. The analyzed final waste slope has a height of approximately 47 ft above surrounding grades at a slope angle of 3:1 (horizontal:vertical). The material properties selected and used in these analyses were based on a preliminary investigation by Converse Consultants, Inc. [Converse, 1999]. The calculations suggest that an apparent internal or interface friction angle of 12 degrees for any component of the composite liner system is the minimum allowable value provides a static factor of safety of 1.6. Furthermore, the calculations suggest that the yield acceleration for the final waste slopes is approximately 1.10 g (where "g" is the gravitational acceleration of 32.2 ft/s^2). Final waste slope stability calculations are presented in Section 2, Calculation Package B of the SRAPI.

3.3 Drainage Pipe Size Requirement

Drainage pipes will be placed on the base liner system to collect and transport potential leachate to the sump for removal. Analyses were performed to model leachate

generation by using the Hydrologic Evaluation of Landfill Performance (HELP) model. The calculations suggest that a 4-inch diameter pipe with four 1/4-inch perforations spaced at 1-ft intervals will accommodate the flow predicted by HELP model analyses. Drainage pipe size calculations are presented in Section 2, Calculation Package C of the SRAPI.

3.4 Pipe Strength

Based on drainage pipe size analyses, a 4-inch diameter drainage pipe will be used for leachate collection and transport. An 18- inch diameter pipe will be used for the side slope riser. Based on the calculations performed for the 4-inch diameter drainage pipe and the 18-inch diameter side slope riser, the appropriate standard dimension ratio (SDR) is 13.5 or smaller. This calculation assumes the maximum height above the pipe of waste is 93 ft (South Mesa). Pipe strength calculations are presented in Section 2, Calculation Package D of the SRAPI.

3.5 Veneer Stability

The design criteria for the side slope liner system is to develop zero tension in the geosynthetics during installation of the operations layer on the side slopes. Potential causes of tension in the liner system include construction equipment loading and overburden stresses (e.g., operations layer materials). Based on the proposed grades and expected construction conditions, the calculations suggest that the side slope liner system will not be placed into tension provided a minimum dry interface friction angle of 18 degrees is maintained and the operations layer is staged in 10-ft high increments inclined at 2.5H:1V. Veneer stability calculations are presented in Section 2, Calculation Package E of the SRAPI.

3.6 Geotextile/Separation/Filtration Requirements

A separation/filtration geotextile will be placed between the operations layer and the drainage aggregate surrounding the leachate collection pipe and as a component of the geocomposite drainage layer. The purpose of the geotextile is to limit migration of fine material from the operations layer into the drainage aggregate and/or geonet component of the geocomposite. The calculations suggest that the separation/filtration geotextile overlying the drainage aggregate layer has an apparent opening size (AOS) less than Sieve No. 70, a permittivity greater than 0.8 sec^{-1}, a minimum mass per unit area of 6 $oz./yd^2$, and sufficient mechanical properties. Geotextile separation/filtration calculations are presented in Section 2, Calculation Package F of the SRAPI.

3.7 Geotextile Cushion Protection

The geomembrane needs to be protected from puncture by particles from the prepared subgrade and operations material. Based upon the selection of using a geocomposite as the drainage layer in the leachate collection system, the geocomposite is selected such that the combined weight of the geocomposite geotextiles will act as an equivalent cushion. With respect to subgrade puncture, the geotextile components of the GCL will protect the geomembrane from the prepared subgrade. This calculation is based on a maximum overburden height of 93 feet. The analysis suggests that the following maximum particle sizes and geotextile mass per unit areas will be required:

Soil Component of Liner	Maximum Particle Size	Minimum Mass per Unit Area
Subgrade	0.75 inch	9 oz./yd^2 (GCL)
Angular Drainage Aggregate	1.00 inch	16 oz./yd^2

Table J -1- Cushion Geotextile requirements

Geotextile cushion protection calculations are presented in Section 2, Calculation Package G of the SRAPI.

3.8 Sump Capacity

The USEPA regulations limit the head over the liner system to less than 12 inches. Therefore, the available capacity to retain the peak daily runoff includes the sump and the volume of 12 inches of leachate in the geocomposite and operations layer extending away from the sump. The maximum, average daily runoff calculated from the HELP model analyses (see drainage pipe sizing calculation) is 231 ft^3. A sump will be located at three low points (two in both the South Mesa and one in the North Mesa). Each sump will be approximately 10 ft x 10 ft x 2 ft deep. The sump has a capacity of approximately 112 ft^3. The capacity of the drainage geocomposite/operations layer extending away from the sump (at a 12-inch head) is greater than 342 ft^3. The combined capacity of the sump and drainage geocomposite/operations layer is 453 ft^3, which exceeds the maximum, average daily runoff noted above of 231 ft^3.

The capacity of the three sumps located throughout the site will be able to accommodate the anticipated peak daily flow (as evaluated from the HELP model – drainage pipe sizing calculation, Section 2, Calculation C of the SRAPI) and meet the EPA requirement of less than 12 inches of head over the liner. Sump and drainage aggregate capacity calculations are presented in Section 2, Calculation Package H of the SRAPI.

3.9 Comparison of Flow Through a CCL and GCL

The calculations suggest that the flow rate through the prescriptive composite liner system containing a compacted clay liner (CCL) is approximately 1.64 times greater than the flow rate through the alternative composite liner system containing a geosynthetic clay liner (GCL). The comparison calculations are presented in Section 2, Calculation Package I of the SRAPI.

3.10 Tension Due to Wind Uplift

The most critical scenario for wind uplift is after the 10-ft vertical height of operations material has been placed against the slope while the remainder of the geosynthetic liner is exposed on the upper portion of the slope. A UV-protective woven geotextile will be installed to overlie the exposed portions of geosynthetics on these cut slopes. The woven geotextile will be subjected to tension due to wind uplift.

Due to proximity of the site, the Las Vegas Airport wind speed data was used for this analysis. A design wind speed of 90 mph is used, which is the peak gust recorded since 1961. This is a conservative design wind speed since the likelihood of this wind speed occurring during the period of construction is very low. Assuming the design wind speed, the calculations suggest that the maximum tension the woven geotextile will experience is 82.8 lb/in. In order to resist the uplift forces from wind loads, the woven geotextile shall have a minimum ultimate wide width tensile strength of 110 lb/in. The tension due to wind uplift calculations is presented in Section 2, Calculation Package J of the SRAPI.

3.11 Anchorage Capacity

The geosynthetics' anchor must have the capacity to withstand potential pullout tension due to wind uplift from the UV-protective woven geotextile. The proposed anchor consists of a 2-ft wide and 2.5-ft deep trench filled with compacted soil. The anchor trench will be overlain by 1 ft of soil with a 3-ft runout length from the top of slope. The capacity of the anchor trench is sufficient to withstand pullout tension from the woven geotextile. The anchorage capacity calculations are presented in Calculation Package K.

3.12 Geocomposite Equivalency Demonstration

A geocomposite layer will be used in lieu of a leachate collection gravel and separation/filtration geotextile. A geocomposite layer, consisting of two 8 oz/yd^2 nonwoven geotextiles bonded to either side of a geonet, is proposed. The top geotextile shall conform to the requirements presented in the geotextile separation/filter calculation

package (Section 2, Calculation Package F in the SRAPI). The combined weight of the geotextiles will act as an equivalent cushion. The calculations suggest that a drainage composite will provide equivalent transmissivity to the aggregate drainage layer. The geocomposite equivalency demonstration calculations are presented in Section 2, Calculation Package L of the SRAPI.

3.13 Consolidation Analysis

Consolidation analyses were performed to evaluate the potential affect on the performance of the proposed liner system under increased loads related to the BRC CAMU. Borings and associated laboratory test results were used for locations beneath the South Mesa (higher loads due to thicker waste profile). Conservative analyses suggest that consolidation will not adversely impact the performance of the proposed liner or leachate collection systems. The consolidation analysis for the South Mesa is presented in Section 2, Calculation Package M of the SRAPI.

In addition, a consolidation analysis was performed to evaluate the effects of the consolidation settlement of waste in the "slit trenches" that will be overlain by the North Mesa disposal area. Since limited information is available regarding the consolidation characteristics of the waste materials contained in the "slit trenches", interpretation was required and the analyses were approached on a conservative basis. The calculations suggest that settlement of waste in the unconsolidated "slit trenches" is likely to cause unacceptable strain in the liner system. As a result, the North Mesa will be pre-loaded with surcharge fill, prior to construction of the overlying liner system, to heights of approximately 36 ft.

Surcharge fill will be monitored using settlement plates to assess the settlement progress and to ascertain the point at which the surcharge is removed and the liner system construction can begin. Since the waste materials contained in the "slit trenches" are primarily inert industrial wastes, long-term settlement due to biodegradation is minimal. Therefore, the time to achieve slit trench consolidation is anticipated to be very short. Settlement will be deemed complete once the difference between any two subsequent settlement plate readings is no more than 5%, or no greater than 0.05 ft change in one week's time.

The calculations suggest that after pre-loading, the strain on the liner system due to differential settlement is within tolerable amounts. In addition, the proposed grading plan can accommodate the calculated post-surcharge differential settlement without significant effects on drainage. The consolidation analysis is presented in Section 2, Calculation Package N of the SRAPI.

Subject: Groundwater Elevations
BRC CAMU
Henderson, Nevada

Dear Dr. Sahu:

In accordance with the Nevada Department of Environmental Protection (NDEP) draft Notice of Deficiency (NOD) dated 13 February 2007, Geosyntec has evaluated the groundwater elevation data associated with the Basic Remediation Company Correction Action Management Unit (CAMU) located in Henderson, Nevada. The proposed CAMU liner system, as illustrated on Drawing J-7, is designed to be a minimum of 5 feet above the groundwater elevation. The groundwater elevations presented on Drawing J-7 were obtained by Montgomery Watson Harza (MWH) in July 2005.

Based on the groundwater contours provided by MWH, the north mesa portion of the CAMU (i.e., the portion over the slit trenches) liner system is greater than approximately 40 feet above groundwater and the south mesa portion of the CAMU liner system (i.e., in the borrow pit area) greater than 5 feet above groundwater. Approximately 93% of the south mesa portion of the CAMU liner system area is more than 10 feet above the groundwater.

The CAMU liner system is designed to limit migration of liquids in the CAMU to the groundwater, which will also limit the migration of groundwater into the CAMU if groundwater were to rise above the base liner system elevation. Furthermore, if groundwater were to rise to an elevation above and migrate through the CAMU liner system, the liquid would be collected in the leachate collection and removal system and would then be removed from the landfill as outlined in the operations plan.

Based on this information, we do not anticipate that rising groundwater levels, if they occur, would adversely impact the performance of the liner system or CAMU.

Sincerely,

Ronald S. Johnson, P.E.
Associate Engineer

1.0 INTRODUCTION

This BRC CAMU Construction Plan outlines the general construction requirements and schedule for the base liner systems. This plan addresses the construction materials, installation, and grading requirements for the BRC CAMU. The rationale for selecting the liner materials is described in the supporting calculations. A Base Liner System Construction Quality Assurance (CQA) plan, base liner system technical specifications, and conceptual drawings are included with the Supplemental RAP Information (SRAPI).

2.0 LINER CONSTRUCTION SCHEDULE AND SEQUENCE

Construction of the CAMU components will be phased so as to increase efficiency of waste disposal. One unit of the BRC CAMU will receive wastes while the base liner system is being constructed for the next unit. These different sections will be divided using storm water controls to reduce surface water, leachate, and waste interaction. The liners in adjacent units will be joined using the seaming techniques outlined in the Base Liner CQA and Technical Specifications (Sections 3 and 4 of the SRAPI, respectively). As lined areas are completed with waste placement, they will be closed and the final cover system will be constructed, as discussed in the CAMU (Landfill) Closure and Post-Closure Plan (Attachment O).

The general construction sequence of the CAMU, as shown on Figure J-4 of the Conceptual Drawings, Section 1, in the SRAPI, is outlined in the following sections.

2.1 Site Preparation

The site will be prepared by removing surface vegetation and portions of the fence currently on site. The temporary perimeter fence will be established and all support facilities brought on-site. At this time, the haul roads and storm water controls (ditches, culverts, silt fences, check dams, and basins) will be constructed. Hot spot excavation of specific areas of the slit trenches will be performed. Surcharge will be constructed, monitored, and removed over the slit trenches in the North Mesa, as shown on Figure J-5 of the Conceptual Drawings. The liner foundation will be graded in accordance with the Conceptual Drawings to prepare for liner installation. The grading requirements are summarized in Section 3 of this Attachment and in shown detail in Section 1 of the SRAPI.

2.2 Liner Installation

After the liner foundation grading, the leachate collection system and liner installation will begin. The flowlines, sumps, and berms for leachate conveyance and storage will be constructed as shown on the Drawings at this time. Liner construction will begin with the installation of the geosynthetic clay liner (GCL), and geomembrane. Requirements for installation are summarized in Section 3 of this Attachment and in detail in the SRAPI.

2.3 Leachate Collection and Removal System Installation

The leachate collection and removal system will be installed next, with collection pipes, drainage aggregate, geotextile, and geocomposite. The geocomposite and filter geotextile will be overlain with 2 feet of soil acting as an operations layer. Requirements of the geocomposite and filter geotextile are summarized in Section 3 of this Attachment and in detail in the SRAPI.

3.0 LINER CONSTRUCTION REQUIREMENTS

3.1 General

This section describes the construction requirements for installation of the base liner system at the BRC CAMU. These construction requirements are necessary in order to ensure that the construction of the liner system is consistent with the design performance goals and assumptions.

3.2 Slope Inclinations

Native soil cut slopes shall be excavated no steeper than a slope inclination of 2.1H:1V. Waste soil slopes shall be placed no steeper than a slope inclination of 3H:1V.

3.3 Drainage Pipe Size Requirement

In accordance with the analyses performed, the drainage pipe shall be 4-inch diameter HDPE pipe with four 1/4-inch perforations per foot of pipe. The side slope riser shall be 18-inch diameter HDPE solid-wall pipe. The standard dimension ratio (SDR) for the 4-inch diameter pipe and the 18-inch side slope riser shall be less than or equal to 13.5.

3.4 Equipment Loading

Equipment loads shall be limited to a maximum loading of 5 psi overlying a minimum of 1 ft of operations materials. In addition, roads for haul trucks shall be a minimum of 3 ft in thickness overlying the liner system.

3.5 Geotextile Requirements

Two geotextile components of the base liner system are utilized, a 6 oz/yd^2 separation/filtration geotextile and a 16 oz./yd^2 cushion geotextile. A UV protective geotextile will be used on the exposed liner system components on the side slopes. To ensure proper manufacturing and durability, the 6 oz/yd^2 separation/filter geotextile shall have the following properties:

Matrix	Nonwoven
Mass per Unit Area	$\geq$ 6 oz/yd^2
Apparent Opening	$\leq$Sieve No. 70
Permittivity	$\geq$ 0.8 sec-1
Grab Strength	$\geq$ 130 lb
Puncture Strength	$\geq$ 40 lb
Ultraviolet strength retention	$\geq$ 70%

The 16 oz/yd^2 cushion geotextile shall have the following properties:

Matrix	Nonwoven
Mass per Unit Area	$\geq$ 16 oz/yd^2
Puncture Strength	$\geq$ 155 lb
Grab Strength	$\geq$ 350 lb
Ultraviolet strength retention	$\geq$ 70%

The UV protective layer woven geotextile shall have the following properties:

Matrix	woven
Wide Width Tensile Strength	$\geq$ 110 lb/in (ultimate strength)
Apparent Opening	$\leq$ Sieve No. 40

3.6 Geosynthetic Clay Liner (GCL)

The GCL component of the base liner system shall have the following properties:

- Index flux > 1.0×10^{-8} ft^3/ft^2-sec;
- Minimum interface shear strength of 12 degrees;
- The GCL shall be dry during installation; and
- combined geotextile mass per unit area of 9 oz/yd^2.

3.7 Leachate Collection Layer

3.7.1 Geocomposite Requirements

In lieu of using drainage aggregate, a geocomposite will be used to collect potential leachate. The selected geocomposite shall have the following properties:

- Transmissivity > 3.05×10^{-5} ft^2/sec under a confining pressure of 12,000 psf and a hydraulic gradient of 0.10;
- an 8 oz/yd^2 non-woven geotextile bonded to each side of the geonet; and
- the top 8 $oz./yd^2$ non-woven geotextile shall have an AOS greater than Sieve No. 70, permittivity greater than 0.6 sec-1, and sufficient mechanical properties.

3.7.2 Geomembrane Requirements

The geomembrane shall be high-density polyethylene (HDPE), have a nominal thickness of 60 mil, and be textured on both sides.

3.8 Prepared Subgrade Requirements

The prepared subgrade shall have a maximum exposed particle diameter less than 3/4 inch.

4.0 RECORDS AND RECORDKEEPING

4.1 General

Liner and Leachate Collection System construction records will be kept in accordance with the CQA plan. The CQA Site Manager will document that all quality assurance requirements have been addressed and satisfied.

The CQA Site Manager will provide the Construction Manager with signed descriptive remarks, data sheets, and logs to verify that monitoring activities have been carried out. The CQA Site Manager will also maintain, at the job site, a complete file of Drawings and Technical Specifications, a CQA Plan, checklists, test procedures, daily logs, and other pertinent documents.

4.2 Daily Recordkeeping

Preparation of daily CQA documentation will consist of daily reports prepared by the CQA Site Manager which will include CQA monitoring logs, and testing data sheets. This information may be regularly submitted to and reviewed by the Construction Manager.

The CQA Site Manager will prepare daily reports that document the activities observed during each day of activity. The daily reports may include monitoring logs and testing data sheets. At a minimum, these logs and data sheets will include the following information:

- the date, project name, location, and other identification;
- a summary of the weather conditions;
- a summary of locations where construction is occurring;
- equipment and personnel on the project;
- a summary of meetings held and attendees;
- a description of materials used and references of results of testing and documentation;
- identification of deficient work and materials;
- results of re-testing corrected "deficient work;"
- an identifying sheet number for cross referencing and document control;
- descriptions and locations of construction inspected;
- type of construction and inspection performed;

- description of construction procedures and procedures used to evaluate construction;
- a summary of test data and results;
- calibrations or re-calibrations of test equipment and actions taken as a result of re-calibration;
- decisions made regarding acceptance of units of work and/or corrective actions to be taken in instances of substandard testing results;
- a discussion of agreements made between the interested parties which may affect the work; and
- signature of the respective CQA Site Manager.

4.3 Construction Problems and Resolution Data Sheets

Construction Problems and Resolution Data Sheets, to be submitted with the daily reports prepared by the CQA Site Manager, describing special construction situations will be cross-referenced with daily reports, specific observation logs, and testing data sheets and will include the following information, where available:

- an identifying sheet number for cross-referencing and document control;
- a detailed description of the situation or deficiency;
- the location and probable cause of the situation or deficiency;
- how and when the situation or deficiency was found or located;
- documentation of the response to the situation or deficiency;
- final results of responses;
- measures taken to prevent a similar situation from occurring in the future; and
- signature of the CQA Site Manager and a signature indicating concurrence by the Construction Manager.

The Construction Manager will be made aware of significant recurring nonconformance with the Drawings, Technical Specifications, or CQA Plan. The cause of the nonconformance will be determined and appropriate changes in procedures or specifications will be recommended. These changes will be submitted to the Engineer for approval. When this type of evaluation is made, the results will be documented and revision to procedures or specifications will be approved by the Contractor and Engineer.

4.4 Photographic Documentation

Photographs will be taken and documented in order to serve as a pictorial record of work progress, problems, and mitigation activities.

4.5 Design Changes

Design changes may be required during construction. In such cases, the CQA Site Manager will notify the Construction Manager. Design changes will be made with the written agreement of the Construction Manager and the Engineer and will take the form of an addendum to the Drawings and Technical Specifications.

4.6 CQA Report

At the completion of the Project, the CQA Consultant will submit to the Construction Manager the CQA report signed and sealed by a Professional Engineer licensed in the State of Nevada. The CQA report will acknowledge: (i) that the work has been performed in compliance with the Drawings and Technical Specifications; (ii) physical sampling and testing has been conducted at the appropriate frequencies; and (iii) that the summary document provides the necessary supporting information. At a minimum, this report will include:

- Manufacturers' quality control documentation;
- a summary report describing the CQA activities and indicating compliance with the Drawings and Technical Specifications which is signed and sealed by the CQA Officer;
- a summary of CQA/CQC testing, including failures, corrective measures, and retest results;
- contractor personnel resumes and qualifications;
- documentation that the geomembrane trial seams were performed in general accordance with the CQA Plan and *Technical Specifications*;
- documentation that field seams were non-destructively tested using a method in general accordance with the applicable test standards;
- documentation that nondestructive testing was monitored by the CQA Consultant, that the CQA Consultant informed the Geosynthetic Installer of any required repairs, and that the CQA Consultant inspected the seaming and patching operations for uniformity and completeness;
- records of sample locations, the name of the individual conducting the tests, and the results of tests;

- record drawings as provided by the Surveyor;
- documentation showing that piping was tested in general accordance with the Technical Specifications; and
- daily inspection reports.

The record drawings will include scale drawings depicting the location of the construction and details pertaining to the extent of construction (e.g., depths, plan dimensions, elevations, soil component thicknesses). Base maps required for development of the record drawings and the record drawings themselves will be prepared by a qualified Professional Land Surveyor registered in the State of Nevada. These documents will be reviewed by the CQA Consultant and included as part of the CQA Report, which will be kept with the project records in accordance with the records retention requirement of the AOC3.

1.0 INTRODUCTION

The purpose of this Operation Plan is to delineate the procedures and operating practices that will be implemented to ensure the safe and efficient excavation, loading, transportation, receipt, and placement of remediation wastes at the BRC CAMU. This Operation Plan summarizes operational procedures discussed in detail in the Corrective Action Plan (CAP) for the BRC Common Areas Remediation Project prepared by Dr. Ranajit Sahu, C.E.M. for BRC dated September 2006. This Operation Plan is intended to provide guidelines to the operator and managers of the BRC CAMU in conducting CAMU operations.

2.0 FACILITIES

2.1 Equipment

The proposed equipment at the BRC CAMU is listed in Table 3 of the CAP. The equipment will be adequate in type, capacity and number, and sufficiently maintained to permit the site operation to meet requirements of these standards. Periodically, the overall maintenance level of site equipment and the quality of site maintenance facilities will be evaluated. In addition, periodically the size and adequacy of the equipment to carry out operations, including the types and quantities of major landfill equipment such as bulldozers, scrapers, compactors, graders and water trucks will be evaluated by the BRC CAMU Construction Manager.

Selection of type, size, quantity, and combination of machines required to move, dry, spread, and compact waste depend on the following factors:

- Amount and type of waste to be handled;
- Weather conditions;
- Compaction requirements;
- Site and soil conditions (topography, soil moisture, and difficulty of excavation); and
- Supplemental tasks such as maintaining roads, assisting in vehicle unloading, and moving other materials and equipment around the site.

In addition to the above, BRC is committed, through either purchase or lease, to provide other equipment to serve as replacements, backups, or supplements to existing operations, or for such special needs that may arise.

2.2 Operation Support

Suitable shelter and sanitary facilities will be provided for operating personnel and waste transport personnel. In addition, a storage area will be provided for BRC CAMU operators to store equipment.

2.3 Access, Traffic Control, and Roads

Site access will be gained through the entry gate located off Fourth Street on the east side of the property. Access will be controlled through full time security (24 hours a day, 365 days per year) during site operations in order to prevent unauthorized vehicular traffic and illegal dumping. In addition to full-time security, access will be controlled by using artificial barriers to protect public health, safety, and the environment. The entry gate will be equipped with a lockable mechanism to prevent unauthorized entry and/or uncontrolled waste deposition when the site is closed. Access to the site at points other than the entry gate will be discouraged by maintenance of site perimeter fencing and full time security during site operations.

The BRC CAMU entrance or gate attendant's office, located beyond the entry gate, will serve as the checkpoint to facilitate access and traffic control. The office will be manned continuously. Loads will be inspected at this point by assigned site personnel. Subsequent to this inspection, loads will be directed to the appropriate BRC CAMU disposal areas.

Temporary roads will be provided as necessary to the working face. All roads will be passable during inclement weather. The entire site will be enclosed with a continuous chain link fence. Figure F-1 through F-3 of the CAP show the locations of the proposed haul roads.

2.4 Signs

At the main entrance gate off Fourth Street a sign will be posted indicating the following:

- Facility name;
- The owner and operator of the site;
- The hours of operation; and
- Materials accepted or excluded.

It will be noted on the signage that the BRC CAMU is a private operation.

Instructional signs will be placed at this site entrance addressing prescribed safety measures on the site and include instructions regarding prohibition of smoking within the disposal areas and mandating that all instruction from site personnel be obeyed.

Interior site haul roads will be appropriately signed so as to direct each load to its designated disposal area. Typical directional and information signs will be posted at the site. Location of signage may be changed from time-to-time to facilitate operations. In addition, authorized personnel may be utilized to direct traffic at the active working face of the landfill operation.

"No Trespassing" signs will be posted at 100-foot intervals along the site perimeter fencing. "Danger- Unauthorized Personnel Keep Out," will be posted at each entrance to the active portion of the BRC CAMU and additional locations as necessary. All signs will be posted in English and Spanish.

Additional signs and/or measures may be required to protect personnel and public health and safety.

3.0 OPERATING CRITERIA

This section presents operating criteria of the BRC CAMU and methodologies to be used to meet such criteria.

3.1 Health and Safety

All activities will be performed in accordance with a Health and Safety Plan(s) (HASP) developed for Site remediation activities by the contractor(s) selected for the project. These HASP(s) shall apply to the contractor's employees and subcontractors. The parameters and details that will be included in the HASP are described in the Accident Prevention, Contingency, and Emergency Response Plan. Briefly, the HASP shall include the following:

- Identification of chemical and physical hazards associated with the remediation activities;
- Minimum training requirements for site workers;
- Minimum Personal Protective Equipment (PPE) for site workers and visitors and criteria for upgrades;
- Air monitoring requirements for workers' breathing zone and site perimeter (for public protection);
- Emergency information, such as emergency telephone numbers and directions to the nearest hospital; and

- Administrative requirements, such as documentation of training, daily health and safety tailgate meetings, and documentation of air monitoring.

A sample Health and Safety Plan table of contents for the BRC CAMU and the Common Areas Remediation Project is included as Appendix D of the CAP.

3.2 Fire Prevention

Fire hazard at the BRC CAMU is expected to be minimal due to the type of material being landfilled. Explosive gases (e.g. methane) are not anticipated at the BRC CAMU because putrescible material will not be accepted at the BRC CAMU for disposal.

No open burning of wastes will be allowed at this site. Fire control protection will be provided by the utilization of on-site equipment such as a water truck, track type dozer and front-end loaders for wetting and smothering accidental fires. In addition, site-related operational vehicles will be equipped with fully functional fire extinguishers. Backup fire protection will be available from units of the Clark County Fire Department.

Site personnel will receive periodic on-the-job training in fire fighting practices conducted by the BRC CAMU Construction Manager and/or other authorized representatives.

3.3 Control of Windblown Material

Scattering of papers, plastic, or other debris by the wind will not be an issue at the BRC CAMU as such types of wastes will not be accepted. Dust control measures will be implemented to limit the amounts of wind-blown dust. Dust control will be accomplished via moisture management and synthetic covers, as required. Operations will cease during periods of high winds, consistent with Clark County requirements as provided in the Dust Control Plan Application included in the CAP.

3.4 Special Waste Disposal

The projected mix of wastes to be received from the service area is a by-product of industrial process fluids allowed to settle in various evaporation ponds. The resulting residual soil is the solid waste requiring disposal. No other special wastes are anticipated.

3.5 Control of Authorized and Unauthorized Waste

The source materials for the BRC CAMU include the residual solids (i.e., sediments and associated soils) from the industrial ponds, ditches, and related source areas. Municipal wastes will not be accepted from private individuals. Unlike typical landfills, both the source material and the BRC CAMU will be under sole control of BRC. Consequently, there will be control over the types of waste materials accepted at the BRC CAMU.

3.6 Disposal of Liquids

Liquids will not be disposed of at the BRC CAMU.

3.7 Control of Explosive Gas

Due to the nature of material to be placed in the landfill, generation of methane or other explosive gases is not anticipated. Controls for explosive gas are not required.

3.8 Disposal of Vegetation

Vegetation, if any, will be removed from excavation areas and access routes. Soil attached to plant roots will be shaken loose and left on the ground surface in the pond in which the vegetation was present, to be collected with the other soils in that pond. The vegetation will be relocated and temporarily stockpiled within the Debris Storage Area, as discussed in the CAP, where it will be tested to determine whether chemicals within the site soils have bioaccumulated within the vegetative matter at levels that would cause it to be unsuitable for disposal at a municipal landfill. In the event that vegetation meets disposal requirements in municipal landfills, they will be so disposed. In the event that contaminate levels dictate that they should be disposed in hazardous waste landfills, they will so be disposed. Vegetation grubbed during excavation will not be disposed in the BRC CAMU.

3.9 Compliance with State Implementation Plan

BRC will ensure that the BRC CAMU does not violate applicable requirements developed by the state implementation plan, if any, approved or adopted by the Administrator of the USEPA, pursuant to Section 110 of the Federal Clean Air Act, as amended (42 U.S.C. § 7410), and the regulations adopted pursuant thereto. As noted earlier, dust mitigation will be ensured by adherence to the Dust Mitigation Plan Application, Appendix C of the CAP. In addition, there will be no open burning of solid wastes at the BRC CAMU.

3.10 Putrescible Wastes and Vector Control

Due to the nature of material to be placed in the BRC CAMU, putrescible wastes and vector control issues do not apply.

3.11 Nuisance Control

The operation and maintenance of the BRC CAMU will be in a manner which will not create odors, unsightliness or other nuisances. There will be no ponded and stored water at the site; thus this source of obnoxious odors and vector breeding is obviated.

As necessary, water or other dust palliatives such as magnesium chloride will be applied to the landfill and its roads to minimize nuisance dust consistent with the Dust Mitigation Plan.

3.12 Disposition, Compaction, and Coverage

Since the waste to be disposed will be soil and sediment a daily cover will not be required to control disease vectors, fires, odors, blowing litter and scavenging. Instead, if operations cease for prolonged periods of time, which is not expected, an intermediate cover will be applied on an as-needed basis. Moisture will be added periodically as needed to reduce dust and particulates.

Solid wastes will be spread and compacted in layers. Waste will be offloaded from the haul vehicles, and spread by a tracked dozer in lifts with a maximum thickness of two feet. A landfill compactor or other suitable equipment will accomplish a sufficient number of passes over each lift in order to reduce voids and produce a compact mass.

The BRC CAMU will be operated to facilitate efficient placement of the waste material. At any given time, the compacted waste mass will be contoured to allow effective drainage in case of inclement (rainy) operations. Construction Sequence Plan, included in the Supplemental RAP Information, presents general steps of landfilling activities.

Horizontal and vertical control is necessary to ensure that the final grades and cell geometry are constructed as planned. The BRC CAMU will be filled to within two feet of the required final elevation. Elevation control for equipment operators at the landfill is achieved through the use of steel pipe grade poles installed in the fill area and marked with red rings against a yellow background at the fill level (two feet below the

final grade). The ring elevations are surveyed with respect to a BRC CAMU surveyed benchmark, which will be a concrete monument.

3.13 Miscellaneous Requirements for Operation

Scavenging through waste at the working face of the BRC CAMU by citizens or non-employees of the landfill operations will be prohibited and is not expected.

The working face area will be inspected daily and lightweight debris will be returned to the fill area and covered.

Provisions will be established concerning weighing and recording all solid waste delivered to the site. Specifically, a scale will be employed to weigh incoming hauling vehicles. The tare weight of each vehicle will be checked on a daily basis to establish the quantities of waste being placed in the BRC CAMU. In addition, topographic surveys will be performed on a quarterly basis to double-check and further quantify the volume of materials placed within the BRC CAMU.

3.14 Control of Erosion, Mud and Dust

An adequate amount of water from storm water or municipal well sources will be available at all times for the control of dust and the compaction of cover material.

Adequate measures will be taken to minimize the creation of dust and minimize safety hazards due to obscured visibility. Roadways will be sprayed with water and/or magnesium chloride to reduce dust generation. Dust control measures are described in detail in the Dust Mitigation Plan Application which is provided as Appendix C of the CAP.

Primary interior roadways will be surfaced with compacted crushed stone or gravel materials, as necessary. Ramps and unloading areas at designated interior disposal areas will be graded for proper drainage with earth-moving and grading equipment.

During periods of wet weather, such surfacing and maintenance practices will be eliminated, or at least minimized to reduce the tracking of mud off-site. During wet periods, the BRC CAMU Construction Manager or his/her designee will be responsible for a daily inspection of the main incoming road and will be responsible for the timely removal of any accumulated mud on that portion of the roadway within the immediate site vicinity. In addition, temporary shaker plates will be installed to minimize tracking of mud off site. Accumulated mud deposits remaining on interior haul road surfaces will be similarly removed as needed by light grading to control dust emissions resulting from normal traffic.

3.15 Run-on and Runoff Control Systems

BRC will provide a system to control run-on and runoff of surface water as outlined in the Technical Drainage Study for Eastside Landfill (PBS&J, 2006). The goal of the run-on system is to collect and control the flow of surface waters entering the BRC CAMU boundaries.

Runoff from the active portion of the BRC CAMU will be managed so as to not cause a discharge of pollutants, silts, or a nonpoint source of pollution from the BRC CAMU into the waters of the state or waters of the United States, including wetlands. Surface water runoff throughout the active portion of the site will be managed to minimize contact of water with solid waste.

Rainfall within the BRC CAMU will be drained away from the active working face. Such drainage will be maintained by constructing each disposal area bottom, or floor, on a uniform grade, with the working face progressing in a downslope direction.

Water coming into contact with the active working face, and thus retained within the BRC CAMU, will be evaporated or may be used for such on-site activities as waste compaction and dust control within the BRC CAMU lined areas. Water not coming into contact with the active working face and collected in the downslope portions of designated water disposal areas may be utilized for such site-related operations as dust control, waste compaction, windblown dust minimization, construction and compaction of disposal area liners, and maintenance of access roadways.

All interim surface water runoff and post closure runoff from the site and surrounding areas will be managed through a series of permanent perimeter drainage channels (Figure J-8). Natural drainage patterns or discharge quantities associated with the site and surrounding areas will not be significantly altered. Runoff will be periodically sampled and tested for general compliance with Nevada National Pollution Discharge Elimination System (NPDES) permit standards.

3.16 Leachate

During waste placement activities, the leachate will be removed from the sumps using portable submersible pumps and will be used for dust control on waste materials placed within the lined limits of the BRC CAMU. Leachate levels will be inspected weekly and after storm events.

3.17 Decontamination

The Contractor will inspect the equipment to confirm that the equipment arrives on the site in a clean state. If obvious indications of contamination are observed, the Contractor will refuse entrance of the equipment onto the site, or decontaminate the equipment before it is used subject to the approval of the Construction Manager. No personal vehicles, "lunch wagons" or other non-essential vehicles will be permitted within the area of active work where the potential to encounter waste may occur. Vehicular traffic will be kept to a minimum. To the extent practical, equipment will be stored when not in use in the location last used or the nearest safe location. Overnight staging in clean areas is not permitted unless the equipment is first decontaminated to prevent the potential for tracking contamination back and forth across the site.

The Contractor will operate the equipment in a manner that minimizes contact with waste, including minimizing the surface area contacting waste and minimizing the potential for spills, drips, splashes or sprays. Equipment, once decontaminated, will be stored in a designated clean area of the site, or preferably removed from the site as soon as practicable.

As described in the CAP, construction equipment decontamination is summarized as follows:

- Transport trucks will be driven across gravel track out aprons with scraping of mud and/or use of water spray to be performed at dedicated decontamination areas.
- Equipment heavily caked with soil and/or other material will be scraped off with a flat-bladed scraper. The scrapings will be placed in the soil staging area for disposal with the excavated soils.
- Equipment will be decontaminated using steam cleaning equipment prior to departure from the work site.

The dozer blades and tracks, and compactor wheels and drum will require decontamination only when removed from the surface of the waste. The frequency of decontamination will be a field decision based on the type of waste materials being encountered.

4.0 REMEDIATION

This section summarizes the excavation procedures, the methods for transporting soils to the BRC CAMU, and documentation which are discussed in detail in the CAP. The BRC CAMU has been sized to contain approximately 3.5 million cubic yards of material, which is significantly in excess of the volume of material calculated to

be disposed. However, in the event that impacted soils exceeding even this maximum BRC CAMU volume are generated, those excess soils will be dispose of off-site, at a properly-licensed facility.

4.1 Soil Excavation

A BRC contractor will complete the excavations in accordance with the plans and specifications developed for this work, under the direction of the BRC Construction Manager. Soil excavation will be performed as described in the CAP. The contractor will use appropriate construction equipment to excavate, load, and transport the materials to the BRC CAMU.

BRC anticipates that 7,500 cubic yards of soil will be excavated, transported, and interred, on average, each day, with the actual volume dependent on equipment used, daily conditions, and hours of operation.

4.2 Dewatering Procedures for TIMET Ponds

Currently, some of the TIMET Ponds contain material with moisture content higher than ideal, or comparably, higher than the excavated soils after dust suppression. Dewatering of these materials is necessary to decrease the moisture content to levels which will reduce the potential for leachate generation. BRC has conducted pilot testing for options to dewater the TIMET Ponds. Based on these studies, BRC may dewater the material in the ponds if needed using a combination of 1) air drying, and 2) draining of liquid through geotextile bag filters. However, BRC expects that moisture will be managed by mixing pond solids with other dry materials destined for the BRC CAMU.

4.3 Soil Transportation to BRC CAMU

To minimize effects on Boulder Highway traffic, remediation will occur during two distinct phases: during daylight hours, work will be restricted to the Eastside Area proper; during evening hours, the contaminated soils excavated during the day from the Eastside Area will be transported across Boulder Highway via the haulage road and then interred into the BRC CAMU.

Soils excavated from the Eastside area will be transported by truck to the BRC CAMU approximately 1.5 to 2 miles away as discussed in the CAP. While the soils to be transported are not hazardous waste, the haulers will possess a valid hazardous waste hauler license and will be certified to handle hazardous waste.

Trucks hauling waste materials from the Eastside Area will enter the BRC CAMU Area from the eastern site ingress/egress at 4th Street. Trucks will then travel

along site access roads adjacent to the BRC CAMU lined landfill area and enter into the BRC CAMU lined landfill area at dedicated access points or ramps. Upon entering the BRC CAMU lined landfill area, the trucks will travel directly on the operations layer above the liner system or above previously placed waste materials. Each truck will be directed to a "working face" where the contents of the truck will be dumped. Trucks will then travel off of the lined landfill area, across "rumble strips" and track-out aprons summarized in Section 3.17 and described in greater detail in the CAP. Water spray will be performed at dedicated decontamination areas as needed to minimize tracking waste materials off of the landfill. Trucks will exit the BRC CAMU Area at 4th Street.

Spillage of soils from trucks during transportation will be minimized by not overloading the transport vehicles, by grading smooth haul roads, and by employing trucks with enclosed or covered cargo bays. Dust will be controlled by water in accordance with the Dust Control and Mitigation Plan Application in Appendix C of the CAP. Because the access routes will be wetted to suppress dust, some mud will be generated, and it is likely that this mud would be transferred to truck tires and the vehicle body. When needed, prior to crossing Boulder Highway, the transport trucks will be decontaminated by scraping and/or water spray to avoid transfer of dirt to the pavement. In addition, after excavation/transport operation cease for a given day, the affected portion of Boulder Highway will be cleaned to remove soils from the roadway.

In the event of an accident resulting in release of the soils being transported, the truck driver will immediately contact the Construction Manager. The Construction Manager will immediately inspect the site of the accident and notify the local emergency management agencies. The potential for immediate threat to workers and people nearby will be evaluated, and the Construction Manager will instruct the remediation contractor to take appropriate corrective steps to rectify the problem. Any spilled material will be returned to the truck (or another truck, if the original truck is disabled) and transport to the BRC CAMU will be complete. If the spill occurred on a public roadway (i.e., Boulder Highway), the spilled material will be removed, and the road surface will be immediately vacuumed to remove remaining materials.

4.4 Soil Placement

The waste material at the working face will be spread by a bulldozer in a lift no greater than two feet in thickness and compacted using standard earthworks construction equipment. The compacted waste material will be tested using a nuclear moisture/density gauge to determine the estimated in-situ moisture content and density of the waste material. The moisture content will be compared to the optimum moisture content result from previously performed moisture/density laboratory testing. Ideally, the in-situ moisture content will be less than the optimum moisture content, thereby minimizing the potential for liquids to "squeeze out" of the waste material upon

placement of overlying materials that will increase the normal static pressure and thus the "squeezing" of the underlying waste material.

Periodically, undisturbed samples of the in situ waste materials will be collected using thin wall samplers (Shelby Tubes) and will be subjected to laboratory one-dimensional consolidation testing. The specifics of the consolidation testing are described in the CAP. If the results of testing indicate that the moisture content of the waste materials is too high, the material will be spread in a thin lift (e.g., 6-inches thick) to allow for evaporation of excess moisture or mixed with drier waste materials to achieve the desired moisture content.

5.0 REPORTING AND RECORDKEEPING

5.1 General

BRC will prepare daily progress reports documenting all daily activities. Daily activity records include, but are not limited to, documentation that evidences the quantity of waste materials placed in the BRC CAMU, truck weigh tickets, and log in/out forms. In addition to this summary daily report, the contractor will also keep detailed field notes and daily logs. Daily photographic and video record will be kept by BRC documenting all remediation activities. Records and results of daily, weekly, and monthly inspections will be maintained and kept onsite consistent with requirements specified in the AOC3.

Records and results of waste analysis and waste determinations will be maintained and kept on site. In addition, all monitoring, testing or analytical data, and corrective action records resulting from BRC CAMU releases shall be maintained onsite consistent with requirements specified in the AOC3. Groundwater monitoring and clean up records will be maintained until closure of the BRC CAMU.

Summary reports of all incidents that require the use of the Contingency Plan will contain the details outlined in Attachment G, Accident Prevention, Contingency, and Emergency Response Plan. The incident reports will be maintained and kept onsite until closure of the BRC CAMU.

Additional items to be included with the operating records are: closure and post-closure cost estimates, plans for closure and post-closure, EPA identification number, detailed chemical and physical analysis of a representative waste sample, Quality Control (QC) and Quality Assurance (QA) documentation.

5.2 Interim Status Reports

During remediation activities at the Site, BRC will submit monthly status reports to the NDEP as stated in the CAP. The purpose of the monthly status reports will be to keep the NDEP informed of the progress of remedial activities at the Site. The reports will present a summary of the remediation progress during the previous month, including as appropriate:

- Significant milestones in CAMU construction;
- Pond and ditch locations where excavation has been completed (including graphical format);
- Pond and ditch locations where special control measures (except dust control, which is routine measure) were necessary and/or where excavation had to be prematurely terminated due to the presence of ground water or based on any of the other "stopping rules" discussed in Figure J; and
- Estimates of volumes of soil excavated and placed in the CAMU (monthly and cumulative). Other information (e.g., discovery of significant environmental conditions previously unidentified) will be provided in the monthly status reports as warranted. Interim status meetings will also be conducted by telephone to supplement these written reports.

Other information (e.g., discovery of significant environmental conditions previously unidentified) will be provided in the monthly status reports as warranted or otherwise required by the AOC3. Interim status meetings will also be conducted by telephone to supplement these written reports.

1.0 INTRODUCTION

This BRC CAMU Monitoring Plan describes the procedures and activities that BRC will undertake to detect and subsequently characterize releases of wastes or hazardous constituents to groundwater that may occur from areas of the BRC CAMU during operation and after closure.

2.0 CONSTRUCTION MONITORING

2.1 Surface water

BRC will carefully maintain drainage to expedite storm water collection. A portable pump will be provided at the low end of the BRC CAMU to remove accumulated storm water. The operator will maintain access to this pump and maintain the pump in good working condition with a good supply of fuel and suction hoses in position for water removal at all appropriate times.

During operating hours, the operator will pump water from the working cell as quickly as possible whenever it accumulates. When heavy rainfalls occur during non-operating hours, standing water will be pumped out before normal operations resume.

Surface water exiting the site from the on-site storm water basin will periodically be sampled and tested for general compliance with Nevada surface water standards for the Las Vegas Wash. BRC will obtain necessary NPDES permits from the NDEP prior to discharge of such waters.

2.2 Leachate

The BRC CAMU will be managed to reduce the generation of leachate. However, leachate, if generated, will slowly accumulate in the leachate collection sumps designed as part of the BRC CAMU. The base grade of the BRC CAMU will be engineered so that leachate generated will accumulate at the designated leachate collection points. The operator will monitor the leachate level and remove and dispose of the leachate, as needed, consistent with proper waste disposal practices. During active waste placement, leachate collected from the sumps will be used for dust control and waste material moisture conditioning purposes over the lined areas only.

As stated in the Inspection Plan (Attachment E), leachate sumps will be monitored weekly and after storm events to confirm proper functioning of the leachate collection and removal system. The amount of leachate will be recorded and the average daily flow rate (gallons per acre per day) will be calculated.

In addition, pan lysimeters will be installed beneath the sump areas of the BRC CAMU to monitor for possible leakage from the liner system at the locations of the lowest elevations in the liner system (sumps), which is where leachate, if any, will accumulate.

2.3 Air Monitoring

Dust control measures and air monitoring will be implemented during the project to comply with the air quality regulations administered and enforced by the Clark County Department of Air Quality and Environmental Management. Air monitoring and sampling will be performed continuously during the project to assess the potential exposure of the general public. Air monitoring stations will be established daily at each soil management zone in the Eastside Area and at the BRC CAMU to measure upwind and downwind fugitive dust emissions as discussed in the CAP. Meteorological conditions will be monitored during the work to assist in determining the proper location of the monitoring stations. Air monitoring for respirable particulates will be performed using a direct-read instrument such as a DataRAM dust monitor. Additional details on air monitoring during the project are in Appendix B, Perimeter Air Monitoring Plan (PAMP) of the CAP.

3.0 POST CLOSURE

3.1 General

Formal periodic inspections will be performed using site walks. These site walks will be performed within one week of significant precipitation events (e.g., greater than ½ inch of rain during a 24-hour period) that could potentially impact either the surface water drainage system or the BRC CAMU cover. At a minimum, a site-wide inspection will be performed at least quarterly.

The condition of the facility will be documented with field notes, maps, and photographs, as appropriate. Evidence of potential compromises in the cover will be recorded including eroded patches, patches of dead vegetation, animal burrows, subsidence, and cracks along the cover. Surface water drainage features will be inspected for the presence of debris, physical integrity, and evidence of conditions that are different from design assumptions.

3.2 Final Cover

Final cover performance will be evaluated through a monitoring program of the final cover and periodic groundwater monitoring. The basis for this strategy is the

fact that the final cover will be the critical element to reduce moisture infiltration into the BRC CAMU. Therefore, it is proposed that monitoring efforts be focused on direct observation, measurement, and analysis of the performance of the final cover.

The final cover system shall be periodically monitored in order to evaluate the performance of the final cover. The final cover monitoring plan consists of:

- visual inspection of the final cover system performed on a semi-annual basis and after all major precipitation events; and
- if erosion has occurred, ascertain damage to the geosynthetics, if any, and repair as necessary in accordance with the Technical Specifications and CQA Plan.

The vegetation on the cover system will be visually inspected for signs of systemic or localized stress. Recommendations will be made regarding the need for nutrient enhancements or other measures to maintain the viability of the vegetative cover, such as the use of pesticides and/or fertilizer.

3.3 Leachate

The leachate collection system will be inspected quarterly and its levels recorded. If the liquid level in the sump stays below the pump operating level for two consecutive quarters, the amount of liquid in the sumps must be recorded at least semi-annually. If the liquid level in the sump stays below the pump operating level for two consecutive periods, the amount of liquids in the sumps must be recorded at least annually. If at any time during the CAMU post-closure care period the pump operating level is exceeded at units on semi-annual or annual recording schedules, BRC will return to quarterly recording of amounts of liquids removed from each sump until the liquid level again stays below the pump operating level for two consecutive quarters.

If leachate is measurable above the pump operating level, the liquid will be removed from the sump, sampled, and analyzed in an off-site laboratory for compounds detected in the waste materials (Waste Analysis Plan, Attachment C), and properly disposed off-site. If compounds not already found in the upgradient groundwater at the site are detected, groundwater monitoring will be performed, on an annual basis, to monitor for the specific constituent(s) detected in the leachate.

Because the proposed BRC CAMU is located in an arid environment receiving approximately 4.5 inches of average rainfall annually, with high rates of evaporation and low infiltration rates, it is unlikely that significant amounts of precipitation will be introduced to the BRC CAMU leachate collection and removal system. These factors will limit the generation of leachate. Moreover, the waste material

consists primarily of soil, which will be monitored for moisture content prior to placement into the landfill.

Pan lysimeters will be installed beneath the sumps to monitor leaks within the collection system. Pan lysimeters will be monitored at the same time as the leachate sumps.

3.4 Settlement

A topography survey using 1-foot contour intervals will be performed within 3 months after final closure of the CAMU to document baseline conditions in support of post-closure settlement evaluations. Although settlement is not expected to be a significant issue, this will provide a convenient mechanism to document the surface elevation. Excessive settlement can lead to depressions and ponding causing stress in the infiltration layer. When depressions are identified through the survey, they will immediately be filled with the appropriate cover material.

3.5 Groundwater

The groundwater at the site ranges from 30 to 60 feet bgs, as discussed in the Draft CAMU Area Conceptual Site Model (DBS&A, 2006). At a minimum, the BRC CAMU base liner is approximately 5 feet above the groundwater. Constituent release to the groundwater from the BRC CAMU, post-closure, is considered unlikely for the following reasons:

- The BRC CAMU will not receive liquid waste or waste containing free liquids;
- Waste materials within the BRC CAMU are relatively immobile;
- The BRC CAMU will be designed and operated to reduce liquid, precipitation, and other run-on and run-off; and
- The BRC CAMU will have both a base liner system, with a leachate collection and removal system, and final cover system.

It should be noted that releases, if any, into the upper aquifer are difficult to monitor because of the nature of the existing groundwater beneath the BRC CAMU. Most or all of the same constituents which will be present in the BRC CAMU are currently present in groundwater at the site. Constituents present in upgradient groundwater make differentiating potential releases from the BRC CAMU difficult or impossible. Nonetheless, groundwater monitoring will be conducted annually through completion of post-closure activities. The list of analytes for such groundwater monitoring will be established based on discussions with the NDEP and will include constituents present in leachate (if any) in the leachate collection and removal system.

Groundwater monitoring will be conducted for a period of at least 30 years from the date of substantial completion of the final closure construction. Analytical results will be compared with historical results and with upgradient and downgradient groundwater results to monitor for anomalies indicating a release from the BRC CAMU.

4.0 REPORTING AND RECORDKEEPING

Monitoring results will be maintained by BRC in accordance with the provisions of the AOC3 following closure of the CAMU. Monitoring results will be summarized and submitted to NDEP with the annual post-closure report of inspection and monitoring activities.

1.0 INTRODUCTION

This section of the permit application addresses the closure of the BRC CAMU, which will occur when disposal operations are complete. This Closure Plan addresses pertinent regulatory requirements, including a description of the final cover. It is anticipated that a final CAMU Closure Plan will be prepared approximately six months prior to closure. By that time, additional details regarding BRC CAMU volume will be available. For purposes of this permit application, the Closure Plan addresses activities that will occur when waste placement activities are complete.

Access to the BRC CAMU will be controlled during the closure phase using procedures employed during the operational phase (see Security Plan, Attachment D). Fugitive dust control measures will be maintained and traffic management procedures continued. Site aesthetics will continue to be an important element during this phase. Community outreach programs will be continued as part of the overall remediation effort (as discussed in the Community Involvement Plan) to address public concerns and issues associated with the BRC CAMU.

1.1 Notice of Intent to Close

At least 60 days before beginning the closure of the BRC CAMU, the NDEP will be notified in writing of the intent to close. BRC CAMU closure activities will begin no later than 30 days after the date on which the final receipt of wastes occurs.

All closure activities will be completed in accordance with this CAMU Closure Plan within 180 days after the beginning of the closure. An extension beyond this 180-day deadline may be requested if it is determined that additional time is needed and all actions are taken necessary to prevent threats to public health and safety and the environment.

A request for an extension to these deadlines will include a description of the measures needed to control access to the unclosed unit prior to closure or receipt of additional wastes. It would also include a description of activities to prevent threats to public health and safety and the environment from the open unit.

1.2 Construction Schedule and Sequence

1.2.1 Final Waste Placement

After receipt of the final waste, either construction of the final cover will begin or an interim cover will be placed. If the unit is going to be left without the final

cover for longer than 30 days, the interim cover layer will be placed and compacted on top of the final waste layer.

1.2.2 Infiltration Layer Construction

Prior to final cover construction, the interim cover layer, if installed, will be removed. The infiltration layer will be placed beginning with the geosynthetic clay liner (GCL). The geomembrane is placed above the GCL with the geocomposite placed last. Details of each layer are discussed in later sections.

1.2.3 Final Cover Construction

The soil materials for the final cover will be placed, compacted, and graded. The permanent storm drain facilities (gutters, ditches, culverts, headwalls, etc.) will be installed as the cover is being completed.

2.0 FINAL COVER COMPONENTS

The final cover is designed to minimize infiltration and erosion. A final cover that reduces infiltration is an essential component in the overall design strategy for the BRC CAMU. This, combined with adequate moisture control of the wastes prior to placement, should ensure that no leachate is formed.

Specific design objectives of the final cover system include:

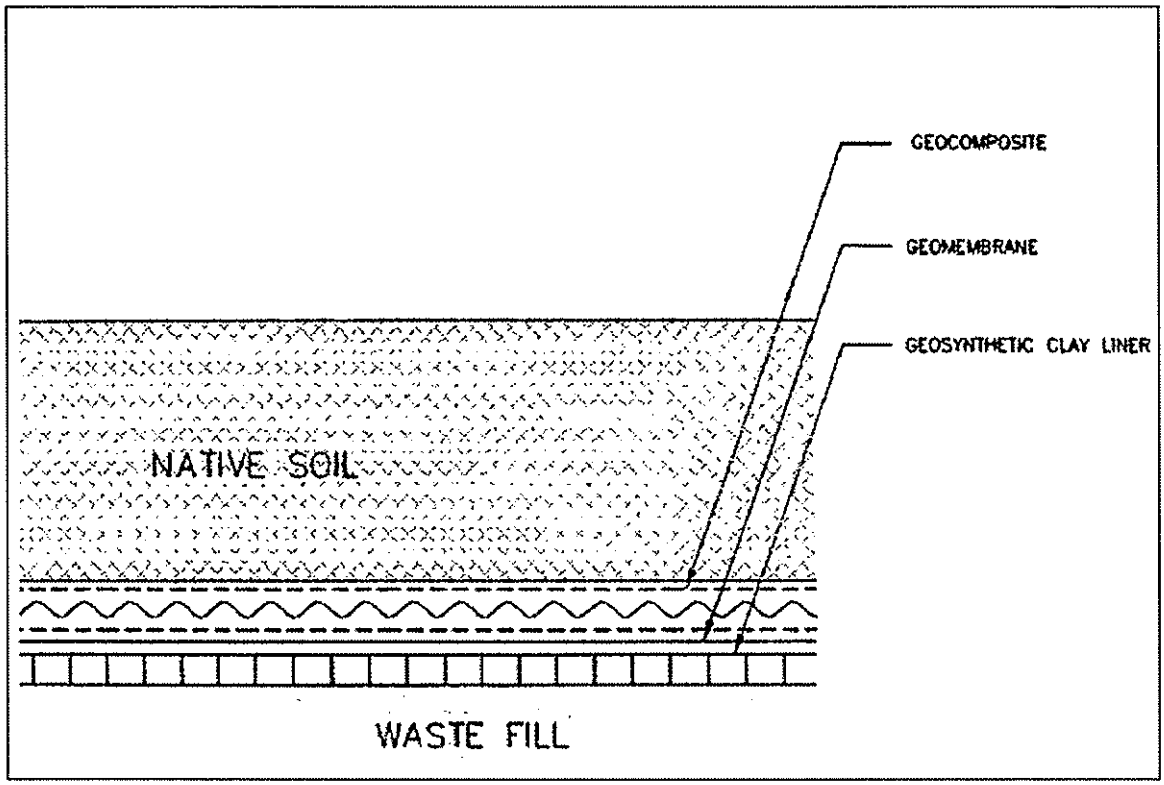
- Minimize infiltration of precipitation into the waste;
- Promote good surface drainage;
- Resist erosion by rain and wind;
- Protect human health and the environment;
- Improve aesthetics;
- Reduce long-term maintenance; and
- Be consistent with land use.

Several of these objectives are directly related to regulatory requirements while the others represent design considerations. BRC CAMU closure technology, design, and maintenance procedures continue to evolve, and it is possible that the cover design for the BRC CAMU may be refined prior to final closure to incorporate the latest design procedures. Modifications or enhancements to this proposed design would be submitted to the NDEP for approval prior to implementation.

Infiltration through the final cover will be minimized through:

- Design of adequate surface drainage and runoff with minimal erosion;
- Transpiration of water by native plants in the root zone, if present; and
- Design of composite barrier system (HDPE geomembrane over GCL) with an overlying drainage layer (geocomposite) to minimize hydrostatic head build-up on the geomembrane.

The final cover will consist of a separate infiltration and erosion layer. Engineering design calculations and construction specifications for the final cover system are presented within Sections 5, 6, and 7 of the Supplemental RAP Information (SRAPI). A cross section of the Final Cover System is shown in Detail O-1 below with an explanation of the components explained in the following sections.



Detail O- 1, Final Cover System

2.1 Infiltration Layer

40 CFR 264.310 specifies that the final cover be designed and constructed to have a permeability less than or equal to the permeability of any bottom liner system. Based on the proposed base liner system, construction of this type of cover will involve the use of a geomembrane and GCL composite liner system to serve as the infiltration layer as shown in Detail O-1 above.

The cover system will be designed to be physically stable to reduce failure, such as sliding between cover layers or within the waste.

Settlement is not expected to be a significant issue given the nature of the waste material and the manner of its placement (i.e. well compacted). Excessive settlement and subsidence at MSW landfills, caused by decomposition and consolidation of the wastes, can impair the integrity of the final cover system. Specifically, it can contribute to ponding of surface water on the cover and fracturing of the low-permeability layers of the cover. However, because the source materials for this BRC CAMU consist primarily of soil materials, the waste placement will be fairly homogeneous with little potential for significant differential settlement. Moreover, the soils will be compacted after placement.

The methods, procedures, and processes used to install the final cover system will be consistent with standard industry practices. Detailed design documents and construction specifications are included in Section 7 of the SRAPI. Included in the CQA plan is a description of quality control testing procedures for the construction materials and associated quality assurance procedures for construction activities. An independent registered professional engineer will be hired to observe closure activities and provide necessary certifications.

2.2 Protection Layer

Protection of the infiltration layer will be accomplished by the use of a 24-inch thick layer consisting of earthen material or an aggregate material (base course). The source for erosion layer soils will be native, clean soil. It is expected to be from the vicinity of the BRC CAMU or from elsewhere in the BMI Common Areas. The earthen material used for the erosion layer will be free of debris, cobbles, rubbish, and roots. If the CAMU materials are used, then they will not be exposed to the atmosphere and will be covered with additional clean materials procured from outside the CAMU area.

The erosion layer will be designed to be geotechnically stable to reduce failure, such as sloughing of the soils overlying the geomembrane/GCL composite infiltration layer (Section 2, Calculation Package I in the SRAPI).

The surface of the erosion layer will have a minimum slope of 2 percent to facilitate run-off while reducing erosion. The side slopes will have a 3H:1V (Horizontal:Vertical) slope. The final grading plan is shown on Figure J-9 in the SRAPI.

2.3 Surface Water Drainage System

A surface water drainage system, designed by PBS&J, will be constructed to convey runoff around and away from waste disposal areas. Surface water will be conveyed around the BRC CAMU to two retention basins located at the northeast and northwest corners of the site. The water will be conveyed by concrete channels and pipes as shown on Figure J-8. The channel and pipe locations correspond to the locations of the access roads for the BRC CAMU. Surface water from the top deck will be conveyed to the conveyance channels via two rip-rap lined channels in the northeast and northwest corners. Drainage channels are designed along existing natural features to enhance surface runoff during high-precipitation events. Based on a 25-year storm event, the design will be sufficient to control erosion and maintain the stability of the slope (PBS&J, 2006).

2.4 Performance Evaluation of the Final Cover

The design of the final cover was evaluated using the Hydrologic Evaluation of Landfill Performance (HELP) model, which was developed by the U.S. Army Corps of Engineers for the USEPA and is widely used for evaluating the hydraulic performance of landfill cover systems (USEPA, 1993). The HELP model calculates daily, average, and worst-case estimates of water movement across, into, through, and out of landfills. The input parameters for the model include soil properties, precipitation and other climatological data, vegetation type, and landfill design information. Useful information provided by the HELP model includes surface run-off, duration, and quantity of water storage within the erosion layer, and net infiltration through the cover system. The information is used for performance evaluation of the geocomposite and drainage pipe sizing, as described in Section 3.4 below.

Site-specific input parameters were used in the HELP model and are documented in Section 5, Calculation Package A in the SRAPI. The results indicated that the net infiltration through the cover system would be 0.000002 in/year.

3.0 SUMMARY OF COVER ANALYSIS

3.1 General

This section summarizes the results of design analyses that were performed for the final cover at the BRC CAMU Landfill site. The following calculations were performed and are located in the respective Calculation Package found in Section 5 unless otherwise noted of the SRAPI:

- Slope Stability Evaluation - Final Waste Slopes (Section 2, Calculation Package B);
- Comparison of Flow between a compacted clay liner (CCL) and geosynthetic clay liner (GCL) (Section 2, Calculation Package I);
- Drainage Geocomposite and Pipe Size Calculations (Calculation Package A);
- Veneer Stability Calculations (Calculation Package B);
- Cover Soil Sloughing Stability Calculations (Calculation Package C);
- Geotextile Filtration Calculations (Calculation Package D);
- Geotextile Puncture Protection Calculations(Calculation Package E);
- Pipe Strength Calculations (Calculation Package F); and
- Seismic Performance Evaluation (Calculation Package G).

The final cover system calculations are based on the conceptual design grading plans shown on Figure J-9 in Section 1 of the SRAPI. Additional calculations and/or design modifications may have to be performed if there are changes to elevation and grade in the aforementioned design grading plans.

3.2 Slope Stability Evaluation - Final Waste Slopes

GeoSyntec analyzed the stability of the final waste slopes for the BRC CAMU as discussed in Attachment J. The slope stability analysis is included in Section 2, Calculation Package B of the SRAPI.

3.3 Comparison of Flow between a CCL and GCL

GeoSyntec demonstrated that the flow rate through the prescriptive composite liner system (i.e. - CCL) is greater than the flow rate through the alternative composite liner system (i.e. - GCL), as discussed in Attachment J. The comparison of flow between a CCL and GCL is presented in the SRAPI, Section 2, Calculation Package I.

3.4 Geocomposite and Pipe Size Calculations

A geocomposite will be placed above the geomembrane to collect and drain surface water that has infiltrated through the cover soil. Drainage pipes will be placed in the final cover to collect water from the geocomposite and drain the water to the perimeter surface water collection channels. Analyses were performed to model infiltration using U.S. Environmental Protection Agency's (USEPA) Hydrologic Evaluation of Landfill Performance (HELP) model. For the calculations presented in this section, it is assumed that irrigation of the final cover will occur in the future. Irrigation rates were estimated based on conversations with Mesquite Country Club and Canyon South Golf Course in Palm Springs, California. GeoSyntec assumed that these operating

golf courses would represent future irrigation rates in the similar climate of Henderson, Nevada. Based on these conversations, the irrigation rates used for the HELP analyses were assumed to be approximately 0.11-in. per day in the winter, fall, and spring, and 0.24-in. per day in the summer. In addition, GeoSyntec assumed a 3-in rainfall event occurred at the end of the simulation year.

Based on these irrigation rates, the head on the cover liner was evaluated to be less than 12-in. at the top deck area, and negligible (i.e., less than 1/10-inch) on the side slopes. Furthermore, the calculations suggest that a 6-in diameter perforated corrugated polyethylene (CPE) pipe bedded in drainage aggregate will accommodate the maximum flow predicted by HELP model analyses. The 6-in. diameter perforated CPE pipe shall have a smooth interior wall to maximize pipe efficiency. Geocomposite and drainage pipe size calculations are presented in the SRAPI, Section 5, Calculation Package A.

3.5 Veneer Stability

The design criteria for the side slope liner system is to develop zero tension in the geosynthetics during installation of the final cover on the side slopes. Potential causes of tension in the liner system include construction equipment loading and overburden stresses (e.g., final cover materials). Based on the proposed grades and expected construction conditions, the calculations suggest that the side slope liner system will not be placed into tension provided a minimum interface friction angle of 20 degrees is maintained. Veneer stability calculations are presented in the SRAPI, Section 5, Calculation Package B.

3.6 Cover Liner Sloughing Stability

Based on the geocomposite and pipe size calculation results, no head buildup is expected above the side slope final cover system geosynthetic components. Calculations suggest that the minimum cover soil shear strength (interface with geocomposite or internal) of 27 degrees will meet the design factor of safety criteria of 1.5. the yield acceleration was found to be 0.15g ($g = 32.2$ ft/s^2). Cover liner sloughing calculations are presented in the SRAPI, Section 5, Calculation Package C.

3.7 Geotextile Filtration Requirements

A separation/filtration geotextile will be used in the following applications: (i) a component of the geocomposite for the final cover system, and (ii) separation/filtration between the cover soil and drainage aggregate. The purpose of the separation/filtration geotextile is to limit migration of fine material from the cover soil into the geocomposite and drainage aggregate, thereby reducing the transmissivity and hydraulic conductivity of the respective materials. The calculations suggest that the

separation/filtration geotextile have an apparent opening size (AOS) less than sieve No. 70, a permittivity greater than 0.5 sec^{-1}, and sufficient mechanical strength properties. Geotextile separation/filtration calculations are presented in the SRAPI, Section 5, Calculation Package D.

3.8 Geotextile Puncture Protection

The geocomposite and geosynthetic clay liner (GCL) will protect the geomembrane from puncture by particles from the prepared subgrade and cover soil. The geotextile components of the drainage geocomposite will protect the geomembrane from puncture by oversized particles in the cover soil. The geotextile components of the GCL will protect the geomembrane from puncture by particles from the prepared subgrade. For the design loading condition, GeoSyntec conservatively assumed an H-20 haul truck tire loading which exhibits a very high force related to hauling equipment. The analysis suggests that the following maximum particle sizes and geotextile mass per unit areas will be required:

Soil Component of Liner	Maximum Particle Size	Minimum Mass per Unit Area
Prepared Subgrade	1.5-in.	9 oz./yd^2 (GCL)
Cover Soil	1-in.	6 oz./yd^2 (single-sided geocomposite)

Table O-1, Geotextile Puncture Protection

Geotextile puncture protection calculations are presented in the SRAPI, Section 5, Calculation Package E.

3.9 Pipe Strength Calculations

Based on drainage pipe size analyses, a 6-in. diameter perforated CPE pipe will be used to collect and transport surface water that has infiltrated through the final cover soil into the geocomposite on the top deck area of the landfill. Based on the calculations performed for the 6-in. diameter perforated CPE pipe, the pipe has adequate strength to withstand equipment (i.e., H-20 haul truck) and soil overburden loads. Pipe strength calculations are presented in the SRAPI, Section 5, Calculation Package F.

3.10 Seismic Performance Evaluation

3.10.1 General

GeoSyntec performed an evaluation of the seismic performance of the BRC CAMU. The evaluation included a seismic hazard evaluation, site response analyses, development of site-specific deformation charts, and seismic deformation analyses for the final cover and base liner of the proposed BRC CAMU.

3.10.2 Seismic Hazard Evaluation

GeoSyntec evaluated the seismic hazard at the site using the most recent United States Geological Survey (USGS) probabilistic seismic hazard maps (Frankel et al., 1996). For compliance with the State of Nevada regulations, GeoSyntec considered motions with 2 percent probability of being exceeded in 50 years for use in design. The USGS data was used to establish the design free-field peak horizontal ground acceleration (PHGA) and set limits on the target acceleration response spectrum for design ground motions. The 2 percent probability of exceedence in 50 years USGS map values indicate that the free-field bedrock PHGA at the site equals 0.34 g from USGS. Based on the deaggregated hazard for Las Vegas, this PHGA was assigned a representative moment magnitude (M_w) of 6.5. The seismic hazard evaluation is presented in the SRAPI, Section 5, Calculation Package G.

3.10.3 Evaluation of Design Ground Motions

A suite of acceleration time histories considered representative of the 2 percent in 50 year ground motions evaluated in the seismic hazard analysis was selected for use in the seismic response analyses. GeoSyntec selected a suite of three time histories that enveloped the target response spectrum using the following methodology: (i) screen the database of acceleration time histories on the basis of earthquake magnitude to select a reduced set of accelerograms; and (ii) plot the acceleration response spectra of the candidate accelerograms against the target acceleration response spectrum and select the representative accelerograms for use in design analyses. Using the above methodology, GeoSyntec selected three candidate accelerograms to represent design ground motions at the BRC CAMU site: (i) the Parkfield earthquake, M_w 6.3, (ii) the Superstition Mountain earthquake, M_w 6.5, and (iii) the Big Bear Lake earthquake, M_w 6.7. Evaluation of the design seismic ground motions are presented in the SRAPI, Section 5, Calculation Package G-1.

3.10.4 Site Response Analyses

One-dimensional site response analyses were performed for the BRC CAMU using the computer program SHAKE91 (Idriss et al., 1992). Analyses were performed for two conditions; (i) 30-ft of contaminated soil placed on the ground surface (i.e., the North Mesa), and (ii) 60-ft of contaminated soil placed 30-ft below grade (i.e., the South Mesa). Shear wave velocity and layer thickness data for the native soil was derived from spectral-analysis of surface waves (SASW) testing performed at the site by Dr. Barbara Luke at the University of Nevada at Las Vegas. Since the depth to bedrock is not known, the thickness to bedrock was varied to evaluate the effect of depth to bedrock on the results of the analysis. The calculated accelerations are all less than 0.50 g and generally

decrease with increasing depth to bedrock. Site response analyses results are presented in the SRAPI, Section 5, Calculation Package G-2.

3.10.5 Site-Specific Seismic Deformation Charts

The site-specific deformation charts were developed using the computer program YSLIP_PM (Yan et al., 1996). YSLIP_PM is based upon the Newmark (Newmark, 1965) method for seismic deformation analysis. YSLIP_PM uses the yield acceleration of the slope (e.g., liner system or final cover system) and the output of the seismic site response analysis to compute seismic deformations. The results indicate that the largest seismic displacement response is calculated by applying the Parkfield earthquake record. The site-specific seismic deformation charts are presented in the SRAPI, Section 5, Calculation Package G-3.

3.10.6 Deformation Analyses

GeoSyntec evaluated the expected seismically-induced permanent deformations at the BRC CAMU. The calculations suggest that the calculated seismically-induced permanent deformations are less than 3-in. for the final cover and less than 6-in. for the base liner. These deformations are less than current generally accepted limits for the final cover and for the base liner. Therefore, the seismic performance of the waste containment system proposed for the BRC CAMU is considered to meet current design standards. The site-specific seismic deformation calculations are presented in the SRAPI, Section 5, Calculation Package G-4.

4.0 COVER CONSTRUCTION REQUIREMENTS

4.1 General

This section describes the construction requirements for installation of the final cover system at the BRC CAMU. These construction requirements are necessary in order to ensure that the construction of the final cover system is consistent with the design performance goals and assumptions.

Technical Specifications and a Construction Quality Assurance (CQA) plan have been prepared for the construction of the final cover system that incorporates the construction requirements presented in this section. GeoSyntec's proposed CQA Plan and Technical Specifications related to the final cover system are presented in the SRAPI, Section 6 and 7, respectively.

4.2 Slope Stability Evaluation

Final cover and interim waste soil slopes shall be constructed no steeper than a slope inclination of 3:1 (horizontal:vertical).

4.3 Geocomposite Requirements

A geocomposite will be used to collect infiltration of surface water through the cover soil. The geocomposite shall have the following properties:

- transmissivity no less than 1×10^{-3} under a confining pressure of 2,000 psf and a hydraulic gradient of 0.10.
- an 6 oz/yd^2 nonwoven geotextile bonded to each side of the geonet for the side slopes (i.e., double-sided) and one 6 oz/yd^2 nonwoven geotextile bonded to the top side of the geonet for the top deck (i.e., single-sided); and
- the 6 oz/yd^2 nonwoven geotextile shall have sufficient permittivity and mechanical properties as summarized in Section 3.7.

4.4 Drainage Pipe Requirements

The drainage pipes used to collect water from the geocomposite shall be 6-in. diameter perforated CPE pipe with a smooth interior wall. The drainage pipes shall be backfilled with aggregate. The aggregate shall have a maximum particle size of 1-inch and a minimum hydraulic conductivity of 1×10^{-2} cm/sec.

4.5 Final Cover Soil

The cover soil shall be placed from the bottom-up, using equipment exerting a ground pressure no greater than 10 psi. Cover soil shall be compacted to minimum of 90 percent of the maximum dry density determined by ASTM D 1557 and have a maximum particle size of 1-in. diameter. Surface water control and drainage shall be promoted.

4.6 Equipment Loadings

Equipment loads shall be limited to a maximum loading of 10 psi overlying a minimum of 1 ft of cover soil. In addition, roads for haul trucks shall be a minimum of 2 ft in thickness overlying the final cover system geosynthetic components.

4.7 Geotextile Requirements

A geocomposite consisting of either one or two geotextile components of the final cover liner system is proposed. The geotextiles will serve a dual purpose - separation/filtration and cushion protection. The geotextile shall have the following properties:

Matrix	Nonwoven
Mass per Unit Area	6 oz/yd^2
Apparent Opening	≤ Sieve No. 70
Permittivity	≥ 0.5 sec-1
Grab Strength	≥ 130 lb
Puncture Strength	≥ 40 lb
Mullen Burst	≥ 210 psi
Trapezoidal Tear	≥ 40 lb
Ultraviolet strength retention	≥ 70%

4.8 Geosynthetic Clay Liner (GCL)

The GCL component of the final cover system shall have the following properties:

- Index flux not greater than 1 x 10^{-8} m^3/m^2-sec;
- Minimum interface/internal shear strength of 20 degrees;
- The GCL shall be dry during installation; and
- combined geotextile mass per unit area of 9 oz./yd^2.

4.9 Geomembrane Requirements

The geomembrane shall be HDPE and have a nominal thickness of 60-mil. The geomembrane shall be double-sided textured on the side slopes and may be smooth on the top deck.

4.10 Prepared Subgrade Requirements

The prepared subgrade shall have a maximum exposed particle diameter less than 1.5-inch.

4.11 Final Cover Surface Treatment

The final cover will require surface treatment to reduce surface erosion due to rainfall or wind forces. There are a wide variety of possible surface treatments to reduce

erosion. For example, cobbles or rip rap can be placed on the outer slope surfaces, aggregate base or crusher-run rock can be applied to flatter surfaces such as the top deck or roadways, and some areas can be treated chemically to bind the soil together. Side slopes typically require a different treatment than the top deck or roadways. The final selection of materials and treatment will be performed prior to commencing closure activities and will be consistent with the NDEP's guidelines for erosion mitigation.

5.0 CAMU POST-CLOSURE PLAN

This section of the permit application addresses post-closure activities for the BRC CAMU, which commence after final closure is completed and extends for a period of 30 years therefrom. This preliminary Post-Closure Plan provides a description of procedures that will be used to maintain the integrity of the final cover system. It is anticipated that the Post-Closure Plan will be updated prior to completing closure activities.

5.1 Requirements After Closure

After closure of the BRC CAMU, a notation on the landfill property deed, or any other instrument that is normally examined during a title search, will be recorded in Clark County. The notation on the deed, or other instrument, will in perpetuity notify any potential purchaser of the property that the land has been used as a landfill and that its use is restricted to uses that would not negatively affect the integrity of the landfill.

Permission may be requested in the future from Clark County to remove the notation from the deed, or other instrument, if all wastes are removed from the site. Any request would document that all wastes have been removed from the facility. Such documentation might include photographs, soil testing in the area where the wastes were deposited, and reports of waste removal activity.

5.2 Program for Postclosure

After closure of the BRC CAMU, a program for post-closure will be conducted as stipulated by the AOC3. This post-closure program will ensure that the integrity and effectiveness of the final cover will be maintained, including making repairs to the cover as necessary to correct the effects of settlement, subsidence, erosion or other events.

Following closure of the CAMU, certification will be submitted to the NDEP verifying closure. This will be signed by an independent Nevada registered professional engineer and will verify that the program was completed in accordance with the CAMU Closure Plan. The certification will be placed in the operating record. The certification

will be based on knowledge of the Closure Plan, observations made during closure, and documentation of closure activities.

Post-closure use of the property will be managed to not disturb the integrity of the final cover, liner or other components of the BRC CAMU (e.g., surface water drainage network, infiltration monitoring system, etc.).

5.3 Land Use

The post-closure use of the BRC CAMU site is to maintain it as open space containing a variety of native vegetation. Access to the site will continue to be restricted. This type of land use will reduce the likelihood that the final cover is inadvertently compromised due to incompatible development. It is anticipated that this land use will be maintained beyond the 30-year required post-closure monitoring duration. However, no land use will be allowed that would compromise the integrity of the final cover system, the liner system, or other components of the containment or monitoring systems.

A precise, metes-and-bounds survey of the closed BRC CAMU will be conducted and the resulting map recorded with the clerk of Clark County. The recordation will include a notation that the property is a Corrective Action Management Unit and contains remediation waste.

5.4 Personnel

Post-closure care personnel will have received adequate training in their specific job duties. This includes applicable OSHA health-and-safety training as well as pertinent training in BRC CAMU maintenance procedures. This staff will consist of a facility manager and various staff workers as needed. The name, address, and telephone number of the facility manager will be provided to the NDEP during the closure process.

Specific duties of these staff will include:

- Limiting access to the site and providing security;
- Performance of routine operations and maintenance activities;
- Responding to public or community inquiries;
- Ensuring regulatory compliance and maintaining appropriate documentation;
- Managing and coordinating post-closure monitoring (i.e., the leachate collection system); and
- Maintenance of the vegetative cover, if necessary.

5.5 Security

The perimeter fencing will remain after closure of the BRC CAMU. Security personnel will not be required 24-hrs because the waste will not be exposed nor will access by the public or domestic livestock pose a health hazard. The perimeter fence will be maintained to deter trespassing. The periodic site inspection walks to assess the cover system will include an evaluation of the perimeter fence.

5.6 Operation and Maintenance

Routine maintenance will be required to maintain the effectiveness of the various BRC CAMU sub-systems. This will include periodic maintenance, and repairs of the final cover, the surface water drainage system, the leachate collection system, and the vegetative cover.

Routine operations and maintenance activities will include frequent inspections of the BRC CAMU. Particular attention will be given to any conditions that could compromise the integrity of the final cover or the associated surface water drainage system or the soil moisture monitoring system. Normal erosion processes are expected to result in the need to periodically replace some cover material and to fill depressions caused by settlement. Extensive maintenance of the vegetative layer is not anticipated since it is being designed to be tolerant of the low rainfall and large temperature extremes in Las Vegas. Occasional fertilizing, if vegetated, may be needed, especially during the first few years after closure.

5.7 Post-Closure Inspections and Monitoring

Post-closure monitoring will be performed as outlined in Attachment N, Landfill (CAMU) Monitoring Plan. In summary, the final cover, leachate, settlement, and groundwater monitoring will be performed for a period of 30 years after closure of the BRC CAMU. Formal periodic inspections will be performed using site walks. These site walks will be performed within one week of significant precipitation events (e.g., greater than ½ inch of rain during a 24-hour period) that could potentially impact either the surface water drainage system or the BRC CAMU cover. At a minimum, a site-wide inspection will be performed at least bi-annually.

At least annually, an internal audit will be performed to verify that all activities at the site have been performed in accordance with the provisions of this Post-Closure Plan. Inspection records will kept and maintained in a log book in order to clearly document any changes in physical conditions. Copies of the inspection report will be provided to the NDEP annually. Post-closure inspections will occur for at least 30 years after BRC CAMU closure.

5.8 Reports and Recordkeeping

The condition of the facility will be documented with field notes, maps, and photographs, as appropriate. Evidence of potential compromises in the cover will be recorded including eroded patches, patches of dead vegetation, extensive or significant animal burrows, subsidence, and cracks along the cover. Surface water drainage features will be inspected for the presence of debris, physical integrity, and evidence of conditions that exceeded design assumptions.

A copy of the plans for closure and post-closure will be maintained in the operating records of the site.

List of Tables

Table Q-1 Closure Cost Estimate

Table Q-2 Post-Closure Cost Estimate

1.0 INTRODUCTION

The estimated and projected cost to close and post close the BRC CAMU is explained in this Attachment. A breakdown of the costs is included in Tables Q-1 and Q-2 of this report. These cost estimates summarized herein are for budgeting and planning purposes only.

The estimate is based on the RS Means Heavy Construction Cost Data for 2006 and professional judgment and experience. The cost is then adjusted for indexes such as city costs and consulting costs. The cost estimates are based on the costs to the owner or operator for hiring a third party to close the facility.

The current closure and post closure cost estimates will remain on site during the operating life of the BRC CAMU.

2.0 CLOSURE COSTS

Components of the final cover system used for this estimate include liner, drainage, and soil cover materials, as shown in Table Q-1. The total cost of CAMU closure is currently estimated at $8,408,000.

3.0 POST-CLOSURE COSTS

The post-closure cost estimate is based on the 30-year cost of annual inspection, monitoring, and maintenance at the BRC CAMU. Inspections, monitoring, and maintenance activities are covered in detail in Attachment O, Closure and Post-Closure Plan. The components of post-closure cost estimate are broken down in Table Q-2. The Net Present Value (NPV) of the 30-year total cost of post-closure is $1,990,000, which is based on a 4% discount rate.

2.2 Operational Records T-1
2.2.1 Construction Quality Control and Quality Assurance T-2
2.3 Interim Status Reports T-3
2.4 Annual Reports T-3
2.5 Biennial Reports T-3
3.0 Post CAMU Closure Reporting and Recordkeeping T-3

1.0 INTRODUCTION

Records of all data, drawings and calculations concerning work proposed or completed at the BRC CAMU will be kept on permanent file in the BRC Data Repository, consistent with document retention requirements specified in the AOC3. In addition, records will be maintained at the BRC offices in conjunction with investigative work at the BRC CAMU. Included in the reports will be appendices with copies of data sheets, log books, and laboratory analysis results. All investigative results will be incorporated into the reports detailed in the following section.

Prior to any document destruction, NDEP will be provided an opportunity to acquire the documents in question.

2.0 OPERATIONAL RECORDKEEPING AND REPORTS

2.1 Training Records

The Construction Manager will maintain records of training received by onsite workers. These records will include copies of certificates received prior to BRC CAMU site activities and site specific training received. The training records will be stored onsite at the facilities maintained by the Construction Manager. Records will be maintained onsite for a period consistent with that specified in the AOC3.

2.2 Operational Records

The contractor will prepare daily progress reports documenting daily BRC CAMU activities. Daily activity records include, but are not limited to, documentation that evidences the quantity of waste materials placed in the BRC CAMU and log in/out forms. In addition to this summary daily report, the contractor will also keep detailed field notes and daily logs documenting:

- the date, project name, location, and other identification;
- a summary of the weather conditions;
- a summary of locations where construction is occurring;
- equipment and personnel on the project; and
- a summary of meetings held and attendees.

Daily photographic and video record will be kept by BRC documenting disposal activities. Records and results of inspections will be maintained and kept onsite for a period consistent with the AOC3.

Records and results of waste analysis and waste determinations will be maintained and kept on site. In addition, monitoring, testing or analytical data, and corrective action records resulting from BRC CAMU releases shall be maintained for three years. Groundwater monitoring and clean up records will be maintained until closure of the BRC CAMU.

Summary reports of all incidents that require the use of the Contingency Plan will contain the details outlined in Attachment G, Accident Prevention, Contingency, and Emergency Response Plan. The incident reports will be maintained and kept onsite until completion of the post-closure period for the BRC CAMU.

Additional items to be included with the operating records are: closure and post-closure cost estimates, plans for closure and post-closure, EPA identification number, detailed chemical and physical analysis of a representative waste sample, Quality Control (QC) and Quality Assurance (QA) documentation.

2.2.1 Construction Quality Control and Quality Assurance

The CQA Site Manager will prepare daily reports that document the activities observed during each day of activity as detailed in the CQA Plans for the Base Liner and Final Cover Systems (Sections 3 and 6 in the SRAPI, respectively). The daily reports may include monitoring logs and testing data sheets. At a minimum, these logs and data sheets will include the following information:

- a description of materials used and references of results of testing and documentation;
- identification of deficient work and materials;
- results of re-testing corrected "deficient work;"
- an identifying sheet number for cross referencing and document control;
- descriptions and locations of construction inspected;
- type of construction and inspection performed;
- description of construction procedures and procedures used to evaluate construction;
- a summary of test data and results;
- calibrations or re-calibrations of test equipment and actions taken as a result of re-calibration;
- decisions made regarding acceptance of units of work and/or corrective actions to be taken in instances of substandard testing results;
- a discussion of agreements made between the interested parties which may affect the work; and
- signature of the respective CQA Site Manager.

2.3 Interim Status Reports

During remediation activities at the Site, BRC will submit monthly status reports to the NDEP. The purpose of the monthly status reports will be to keep the NDEP informed of the progress of remediation activities at the Site. The reports will present a summary of the remediation progress during the previous month, including as appropriate, significant milestones in BRC CAMU construction, locations of completed pond and ditch excavation (including graphical format), and estimates of soil volumes excavated and placed in the BRC CAMU.

2.4 Annual Reports

BRC will submit an annual report of the solid wastes received at the site to the NDEP. This report will be submitted in a format mutually agreed to between BRC and NDEP. The report will consist of data reported in units of tons and cubic yards for waste materials received at the BRC CAMU.

The annual report will be submitted to NDEP and will include data compiled throughout the year. The total quantity of wastes deposited and the remaining capacity of the BRC CAMU in cubic yards will be incorporated. In addition, the leachate quality data will be compiled and the status of the leachate collection, including quantity of leachate collected on-site and disposed on a monthly basis, reported. Finally, any changes from the approved report, plans, and specifications, with justifications.

2.5 Biennial Reports

BRC will submit a biennial report by March 1 of each even year to the NDEP on EPA form 8700-13B. The report will summarize activities at the BRC CAMU for the previous two years. The report will contain: EPA identification number, BRC CAMU address, dates covered, description of wastes received, method of waste disposal, most recent closure and post-closure cost estimates, methods utilized to reduce waste volume, and any changes in waste volumes. This report will be signed by BRC.

3.0 POST CAMU CLOSURE REPORTING AND RECORDKEEPING

Maintenance inspection records will kept and maintained in a log book in order to clearly document any changes in physical conditions. Copies of the inspection report will be provided to the NDEP annually.

Results of monitoring will be kept and maintained onsite for a period of at least 30 years after closure. Copies of the monitoring will be provided to NDEP with the inspection report annually.

The condition of the facility will be documented with field notes, maps, and photographs, as appropriate. Evidence of potential compromises in the cover will be recorded including eroded patches, patches of dead vegetation, animal burrows, subsidence, and cracks along the cover. Surface water drainage features will be inspected for the presence of debris, physical integrity, and evidence of conditions that exceeded design assumptions.

1.3 The Endangered Species Act U-2

1.4 The Coastal Zone Management Act U-2

1.5 The Fish and Wildlife Coordination Act U-3

1.0 INTRODUCTION

This attachment discusses how the BRC CAMU is in compliance with the following Federal Laws.

1.1 The Wild and Scenic Rivers Act

The Wild and Scenic Rivers Acts protects river areas and their immediate environments for the present and future generations. Rivers are eligible for protection if they display one or more of the following characteristics:

1. *Wild river areas* -- Those rivers or sections of rivers that are free of impoundments and generally inaccessible except by trail, with watersheds or shorelines essentially primitive and waters unpolluted. These represent vestiges of primitive America.

2. *Scenic river areas* -- Those rivers or sections of rivers that are free of impoundments, with shorelines or watersheds still largely primitive and shorelines largely undeveloped, but accessible in places by roads.

3. *Recreational river areas* -- Those rivers or sections of rivers that are readily accessible by road or railroad, that may have some development along their shorelines, and that may have undergone some impoundment or diversion in the past.

There are no rivers in the vicinity of the BRC CAMU site with the exception of the Las Vegas Wash which is approximately 2 miles north of the Site, and the Las Vegas Wash is not designated as a Wild and Scenic River.

1.2 The National Historic Preservation Act of 1966

The National Historic Preservation Act protects, rehabilitates, restores and reconstructs the districts, sites, buildings, structures, and objects significant in American history, architecture, archaeology, or culture.

There are no locations of historical significance at the BRC CAMU site. BRC contacted the Nevada Natural Heritage Program and requested a search of their database. No locations of historical significance were identified as a result of this search. A copy of the seach result is provided in Appendix A to this Attachment.

1.3 The Endangered Species Act

The city of Henderson, along with other cities within Clark County, submitted an application to the EPA for a permit to incidentally take desert tortoises (*gopherus agassizii*), pursuant to section 10(a)(1)(B) of the Endangered Species Act of 1973, as amended (Act), in association with various proposed public and private projects in Clark County, Nevada. The permit allows incidental take of desert tortoises for a period of 30 years, resulting from development on up to 113,900 acres of private lands within Clark County, Nevada. The permit application was received September 28, 1994, and was accompanied by the Clark County Desert Conservation Plan (CCDCP), which serves as the Applicant's habitat conservation plan and details their proposed measures to minimize, monitor, and mitigate the impacts of the proposed take on the desert tortoise.

To minimize the impacts of take, Henderson provides a free pick-up and collection service for desert tortoises encountered in harm's way within the city. These desert tortoises will be made available for beneficial uses such as translocation studies and programs, research, education, zoos, museums, or other programs approved by the Service and Nevada Division of Wildlife. Sick or injured desert tortoises will be humanely euthanized.

Henderson approves the issuance of land development permits for otherwise lawful public and private project proponents during the 30-year period in which the proposed Federal permit is in effect. Henderson imposes a fee of $550 per acre of habitat disturbance to fund the measures to minimize and mitigate the impacts of the proposed action on desert tortoises.

The BRC CAMU will be in compliance with the Endangered Species Act through a fee of $550 per acre submitted with the grading permit application. If a Desert Tortoise is encountered during construction, the City of Henderson will be contacted and the tortoise relocated.

The above discussion notwithstanding, BRC does not believe that there are any threatened and endangered species in the CAMU area. BRC requested that Nevada Natural Heritage conduct a search related to such species. The letter from Nevada Natural Heritage provided in Appendix A to the Attachment confirms that there are no at risk taxa in this area.

1.4 The Coastal Zone Management Act

The Coastal Zone Management Act seeks to manage and preserve the nation's coastal resources, ensuring their protection for future generation.

The BRC CAMU site is not located near any coasts.

1.5 The Fish and Wildlife Coordination Act

The Act provides that whenever the waters or channel of a body of water are modified by a department or agency of the U.S., the department or agency first shall consult with the U.S. Fish and Wildlife Service and with the head of the agency exercising administration over the wildlife resources of the state where construction will occur, with a view to the conservation of wildlife resources. The Act provides that land, water and interests may be acquired by federal construction agencies for wildlife conservation and development. In addition, real property under jurisdiction or control of a federal agency and no longer required by that agency can be utilized for wildlife conservation by the state agency exercising administration over wildlife resources upon that property.

The BRC CAMU will not modify the waters or channel of a body of water.

RE: Data request received 23 February 2007

Dear Mr. Sahu:

We are pleased to provide the information you requested on endangered, threatened, candidate, and/or At Risk plant and animal taxa recorded within or near the BRC Common Areas-CAMU Project area. We searched our database and maps for the following a 5 kilometer radius around including:

Township 22S Range 62E Sections 11 and 12

There are no at risk taxa recorded within the given area. However, habitat may be available for: the big free-tailed bat, *Nyctinomops macrotis*, a Nevada Bureau of Land Management (BLM) Sensitive Species; the spotted bat, *Euderma maculatum*, a Nevada BLM Special Status Species; the Arizona toad, *Bufo microscaphus*, a Nevada BLM Sensitive Species; the desert tortoise, *Gopherus agassizii*, a Federally Threatened Taxon; the chuckwalla, *Sauromalus ater*, a Nevada BLM Sensitive Species; and the banded Gila monster, *Heloderma suspectum cinctum*, a Nevada BLM Special Status Species. We do not have complete data on various raptors that may also occur in the area; for more information contact Ralph Phenix, Nevada Division of Wildlife at (775) 688-1565. Note that all cacti, yuccas, and Christmas trees are protected by Nevada state law (NRS 527.060-.120), including taxa not tracked by this office.

Please note that our data are dependent on the research and observations of many individuals and organizations, and in most cases are not the result of comprehensive or site-specific field surveys. Natural Heritage reports should never be regarded as final statements on the taxa or areas being considered, nor should they be substituted for on-site surveys required for environmental assessments.

Thank you for checking with our program. Please contact us for additional information or further assistance.

Sincerely,

Eric S. Miskow
Biologist III/Data Manager

GENERAL NOTES

1. UNLESS OTHERWISE INDICATED ON THE DRAWINGS, THE TOPOGRAPHY, INCLUDING HORIZONTAL AND VERTICAL CONTROLS ARE FROM A SURVEY BY PENTACORE GEOGRAPHIC INFORMATION SYSTEMS, 6763 WEST CHARLESTON BLVD, LAS VEGAS, NEVADA, DATED SEP. 9, 1999.

   1.1. BASIS OF VERTICAL CONTROL:
   CITY OF HENDERSON BENCHMARK NO. 5 – BOLT AND WASHER IN THE TOP OF THE CURB ON THE EAST SIDE OF HIGHWAY 93, 100 FEET +/– NORTHWEST OF THE CENTERLINE OF KING STREET.

   NAVD 1988 DATUM ELEVATION = 519.021 METERS 1702.821 FEET

   1.2. BASIS OF HORIZONTAL CONTROL:
   THE BASIS OF BEARINGS FOR THIS PROJECT IS GRID NORTH AS DEFINED BY THE NEVADA COORDINATE SYSTEM OF 1983 (NCS83), EAST ZONE, (2701), DETERMINED BY GIS CONTROL POINTS, "851" , "884" AND "W51" AS SHOWN ON A RECORD OF SURVEY ON FILE IN THE CLARK COUNTY RECORDER'S OFFICE, IN FILE 88 OF SURVEYS, AT PAGE 53.

2. A PRELIMINARY GEOTECHNICAL AND GEOLOGIC INVESTIGATION NO. 99–33437–01, DATED OCTOBER 22, 1999 PREPARED BY CONVERSE CONSULTANTS IS PART OF THE CONSTRUCTION DOCUMENTS.

3. THE CONTRACTOR SHALL BE RESPONSIBLE FOR THE FIELD INVESTIGATION OF THE EXISTING CONDITIONS AND FOR THE FIELD VERIFICATION OF EXISTING UNDERGROUND UTILITIES WITHIN THE PROPOSED WORK AREA. IF UNKNOWN UNDERGROUND UTILITIES ARE ENCOUNTERED DURING EXCAVATION, THE SUBCONTRACTOR SHALL IMMEDIATELY NOTIFY CONSTRUCTION MANAGER PRIOR TO CONTINUING THE WORK IN THE IMMEDIATE VICINITY.

4. THE CONTRACTOR SHALL PROTECT EXISTING UNDERGROUND AND ABOVEGROUND LINES AND ANY EXISTING IMPROVEMENTS AND EQUIPMENT WITHIN THE PROJECT LIMITS. ANY EXISTING CONSTRUCTION DAMAGED BY CONTRACTOR OPERATIONS SHALL BE REPAIRED OR REPLACED AT THE CONTRACTOR'S EXPENSE.

5. ALL UNDERGROUND UTILITIES SHALL BE PROPERLY PROTECTED DURING CONSTRUCTION FROM HEAVY EQUIPMENT BY THE USE OF SUITABLE TIMBER MAT OR STEEL MATTING.

6. DIMENSIONS, ELEVATIONS, AND LOCATION OF EXISTING UTILITIES ARE TO BE FIELD VERIFIED BY CONTRACTOR PRIOR TO START OF CONSTRUCTION.

7. STRAIGHT GRADE BETWEEN SPOT ELEVATIONS SHOWN UNLESS OTHERWISE INDICATED ON THE PLANS.

8. FINISHED SURFACES SHALL BE SLOPED UNIFORMLY FROM HIGH POINTS, RIDGE LINES, AND AROUND OBJECTS TO FLOW LINES AND AREA DRAINS UNLESS INDICATED OTHERWISE.

9. THE GEOTECHNICAL ENGINEER SHALL PROVIDE SUFFICIENT INSPECTIONS DURING THE EXCAVATION OF THE NATURAL GROUND AND THE PLACEMENT AND COMPACTION OF THE FILL TO BE SATISFIED THAT THE WORK IS BEING PERFORMED IN ACCORDANCE WITH THE PLANS AND SPECIFICATIONS.

10. EXCAVATION, EMBANKMENT, AND BACKFILL WORK AREAS SHALL BE CONTINUALLY AND EFFECTIVELY DRAINED. WATER SHALL NOT BE PERMITTED TO ACCUMULATE IN EXCAVATION OR FOUNDATION AREAS. THE SUBCONTRACTOR SHALL PROVIDE SUITABLE DIKES, DRAINS OR SHALL PROVIDE PUMPING EQUIPMENT AS REQUIRED TO DIVERT WATER FLOW AWAY FROM THE WORK AREAS.

11. SLOPES SHOWN ON GRADING PLANS ARE FOR INFORMATION ONLY. ACTUAL LINES SHALL BE VERIFIED BY FIELD MEASUREMENTS.

12. THE CONTRACTOR SHALL PERFORM GRADING OPERATIONS IN ACCORDANCE WITH EARTHWORK SPECIFICATION, SECTION 02200.

13. SUBCONTRACTOR SHALL COORDINATE WITH OTHER SUBCONTRACTORS IN THE WORK AREA. ANY DISPUTES BETWEEN SUBCONTRACTORS SHALL BE RESOLVED THROUGH THE CONSTRUCTION MANAGER.

14. THE SUBCONTRACTOR SHALL IMMEDIATELY NOTIFY CONSTRUCTION MANAGER FOR PROVISIONS OF THE APPROPRIATE MEANS OF DECOMMISSIONING UNDERGROUND UTILITIES ENCOUNTERED IN THE FIELD WITHIN HIS WORK PACKAGE LIMITS.

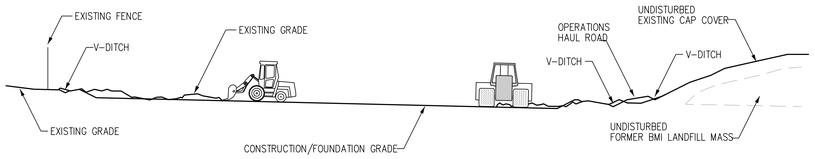
1

- REMOVE ANY INTERFERING PORTION OF EXISTING FENCE
- CLEAR AND REMOVE BRUSH AND RUBBLE
- INSTALL INTERIM PERIMETER FENCE AND ACCESS GATES
- CONSTRUCT OPERATIONS SUPPORT FACILITIES
- GRADE TO FOUNDATION TO RECEIVE LINER LAYER

- CONSTRUCT OPERATIONS HAUL ROAD
- CONSTRUCT EROSION CONTROL FEATURES – DITCHES, CULVERTS, SILT FENCES, CHECK DAMS, AND BASINS

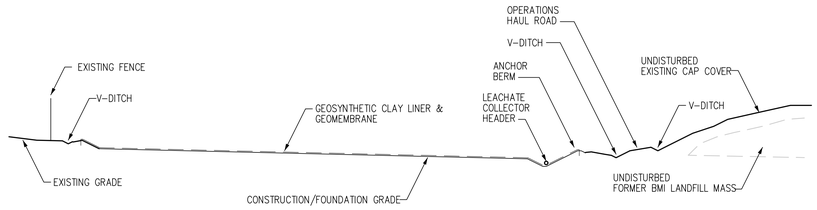


NOT TO SCALE

2

- CONSTRUCT FLOWLINES, SUMPS, AND BERMS FOR LEACHATE COLLECTION SYSTEM AND LINER ANCHOR

- INSTALL GEOSYNTHETIC CLAY LINER, GEOMEMBRANE AND GEOCOMPOSITE

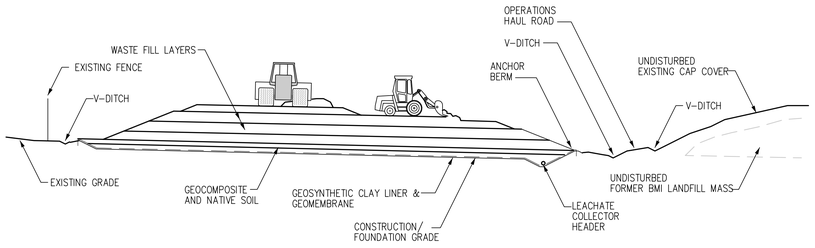


NOT TO SCALE

3

- INSTALL LEACHATE COLLECTION SYSTEM
- INSTALL BALANCE OF COMPOSITE LINER: GEOCOMPOSITE AND NATIVE SOIL

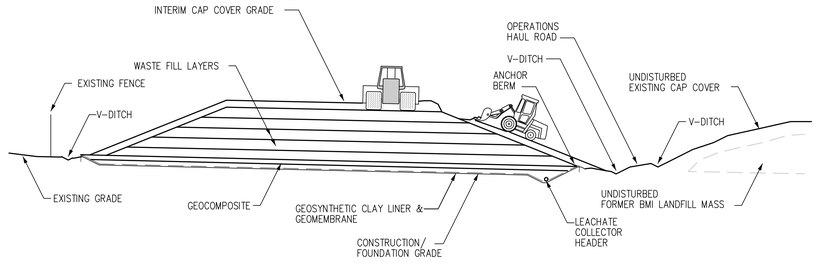
- AT REMOVAL SITE: STOCKPILE AND LOAD WASTE FOR TRANSPORT
- AT LANDFILL SITE: UNLOAD, PLACE, COMPACT AND GRADE WASTE FILL IN LAYERS



NOT TO SCALE

4

- PLACE, COMPACT AND GRADE SOILS MATERIAL FOR INTERIM CAP COVER

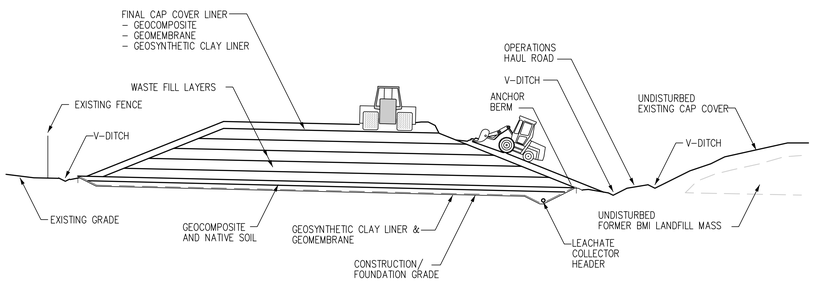


NOT TO SCALE

5

- REMOVE INTERIM CAP COVER

- INSTALL FINAL CAP COVER LINER – GCL, GEOMEMBRANE AND GEOCOMPOSITE

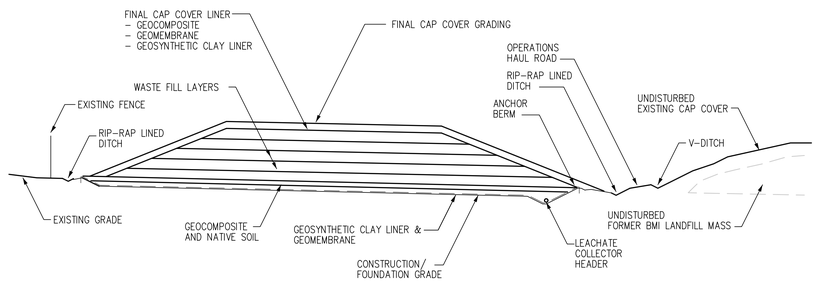


NOT TO SCALE

6

- PLACE, COMPACT AND GRADE SOILS MATERIAL FOR FINAL CAP COVER

- INSTALL PERMANENT STORM DRAINAGE FACILITIES (GUTTERS, DITCHES, CULVERTS, HEADWALLS, ETC)



NOT TO SCALE

SLOPE STABILITY EVALUATION
CUT SLOPES
BRC CAMU
HENDERSON, NEVADA

OBJECTIVE

The objective of this calculation package is to evaluate the stability of cut slopes (inclined at 2.1H:1V) at the BRC Corrective Action Management Unit (CAMU) in Henderson, Nevada.

DESIGN CRITERION

Because the cut slopes at the BRC CAMU will eventually be buttressed by waste they are considered interim slopes, which are normally required to exceed a static factor of safety of 1.3. However, due to limited information regarding shear strength parameters for on-site soils, GeoSyntec employed a static factor of safety equal to or greater than 1.4 as the interim slope static stability criterion. In consideration of the limited duration which the interim slopes will exist, seismic stability analyses of the cut slopes were not conducted.

METHOD OF ANALYSIS

The slope stability computer program PCSTABL5 (Achilleos, 1988) was employed for this analysis. PCSTABL5 employs limit equilibrium principles to provide general solutions to slope stability problems. Potential sliding surfaces, both circular and polygonal, can be specified or randomly generated. The Modified Janbu Method is used herein, as recommended in the PCSTABL5 manual (Achilleos 1998) for circular and polygonal failure surfaces.

In addition to the above analyses, the stability of the cut slopes is evaluated using the infinite slope methodology. An inifinite slope (or surficial sliding) without seepage in the slope is defined as:

$$FS = \frac{c}{\gamma H \cos^2 \beta \tan\beta} \frac{\tan\phi}{\tan\beta} \quad \text{(Das 1994)} \qquad \text{(Equation 1)}$$

SUBSURFACE INFORMATION

Based on results of subsurface explorations by others (Converse 1999), the subsurface is characterized by alluvial granular soils overlying fine-grained soils encountered at depths from approximately 34-ft to 55-ft below the surface. The granular subsoils generally consist of medium to very dense granular fill and native soils overlying localized zones of moderately hard to hard cemented sand and gravel. The fine-grained soils consist of lean clays and high plasticity silts. Field and laboratory test results indicated that the native granular soils at the site have a low compressibility and moderate to high internal friction angles (Converse 1999). The fine-grained soils encountered at depth at the site generally were found to be moderately compressible, have a high expansion potential, and have relatively low permeability (Converse 1999). Groundwater was encountered at depths between 30-ft and 58-ft and was, in general, located at the approximate elevation of the lean clay layer (Converse 1999).

NATIVE MATERIAL PARAMETERS

Native material within the limits of the BRC CAMU consists of alluvial granular soils overlying fine-grained soils. Shear strength parameters for the native soil material were previously estimated and reported in the *Preliminary Geotechnical and Geologic Investigation - Industrial Non-Hazardous Disposal Facility* (Converse 1999). Twelve exploratorary borings were conducted by others to depths ranging from 33-ft to 60-ft (Converse 1999). In general, the native materials appear to be consistent between borings. Direct Shear tests were performed on selected samples retrieved from the exploratory borings. A summary of the Direct Shear test results as reported by Converse (1999) are presented in Attachment 1.

Based on data obtained by Converse (1999), the *in situ* silty sand with gravel material (fill and native) can be characterized by a moist unit weight of approximately 117 pcf (see Attachment 1 - boring logs). The sandy lean clay can be characterized by a saturated unit weight of approximately 102 pcf (see Attachment 1 - boring logs).

Based on the boring logs provided by Converse (1999), the average groundwater elevation in the vicinity of the cut slopes (borings B-8, B-12, B-5, B-4, and B-10) is approximately 49 feet below the surface (at the top of the CL layer).

Upon review of the direct shear tests performed by Converse at the BRC CAMU site, GeoSyntec has employed its own interpretation of the on-site material properties. The direct

Written by: Ed Zielanski Date: 5 / 27 / 05 (MM DD YY) Reviewed by: GTC Date: 6 / 2 /05 (MM DD YY)

Client: BRC Project: BRC CAMU Project No.: SC0313 Task No. 01-02

shear tests performed by Converse involved shearing the soil at a relatively low normal stress, then returning the specimen to its original position, placing a larger normal stress and re-shearing the sample. This process was repeated for three different normal loads. Therefore, based on the description of the testing methods, it is unclear as to the appropriate design shear strength parameters for the on site soil.

In recognition of this, GeoSyntec has reviewed the borings logs in order to evaluate the design shear strength parameters. The boring logs indicate that the *in situ* silty sand with gravel soil (SM) is primarily dense to very dense (i.e, very high blow counts). Based on a correlation by Peck, Hanson, and Thornburn (1974), dense silty sands typically have internal friction angles on the order of 30 to 35 degrees (Attachment 4). Due to the high density of the SM material, it is assumed that the effective friction angle of the SM material to be 35 degrees. At numerous locations shown in the boring logs, the SM material was described as partially cemented. However, based on the borings logs, it is unclear as to the extent or the degree of cementation in the profile. Therefore, it is conservatively assumed that the effective cohesion of the SM material is zero.

A sandy lean clay (CL) layer exists approximately 34 to 55 feet below the surface. Based on a review of the boring logs in the area of the proposed cut slopes, the average depth to the CL layer (for borings B-8, B-12, B-5, B-4, and B-10) is approximately 49 ft. The moisture content of the lean clay is relatively close to the liquid limit, indicating a normally consolidated deposit. Therefore, the undrained shear strength of the lean clay layer can be approximated using correlations based on the plasticity index. A representative value from Converse (1999) for the plasticity index of the CL material is on the order of 32 percent (Attachment 1). Ladd (1990), presents a relationship between the plasticity index and the c/p ratio. Based on this correlation, the c/p ratio is approximately 0.24 (Attachment 2). An example calcuation to estimate the undrained shear strength at a depth of 54 feet is shown below:

Assume the SM material and water table extends to a depth of 49 ft. Therefore, the effective vertical stress, σ'_v *is:* $(\gamma_{SM})(z_{SM})+(\gamma' t_{CL}) = (117)(49\ ft)+(102\text{-}62.4)(54\text{-}49) = 5{,}931\ psf$. *The c/p ratio is assumed to be 0.24, therefore, the undrained strength is* $(0.24)(5931) \approx 1{,}400\ psf$.

CROSS SECTIONS

One cross section (cross section A-A') was developed to evaluate the stability of the cut slopes at the BRC CAMU. The location of this cross section is indicated on Figure 1. Cross section A-A' is a 44-ft high cut slope and represents the most critical cross section. The slope of the cross section is inclined at 2.1H:1V (horizontal:vertical).

ANALYSIS AND RESULTS

Proposed Cut Slopes – 2.1H:1V

Global Stability. Based on data from Converse (1999), the groundwater table appears to be located approximately at the elevation of the lean clay layer. In recognition of this, a piezometric surface was included in the analyses to represent the water table. The water table is placed at the top of the lean clay layer.

Two types of potential failure surfaces were analyzed, (i) circular, and (ii) polygonal. The polygonal potential failure surface assumes the failure surface occurs between the weakest interface between the silty sand (SM) and the lean clay (CL). Potential failure surfaces were evaluated using the search option of the PCSTABL5 program. Program input parameters, specifying the range of beginning and ending locations for potential circular failure surfaces, were varied by the user to focus on the location of the most critical potential failure surfaces for the given cross section.

Graphical output of the most critical potential failure surfaces of cross section A-A' is presented in Figures 2, 3, and 4. The graphical output of Figures 2 and 3 illustrates the ten most critical potential circular failure surfaces found by the PCSTABL5 analysis. The graphical output of Figures 2 and 3 illustrates the ten most critical polygonal failure. Analyses indicate that the most critical potential failure surface of cross section A-A', possesses a factor of safety of 1.46. This factor of safety satisfies the design criterion of a factor of safety equal to or greater than 1.4.

Computer output of the stability analyses for the potential surfaces of cross section A-A' is included in Attachment 3.

Surficial Sliding or Sloughing. Based on the assumption of zero cohesion for the SM material, Equation 1 becomes:

Written by: Ed Zielanski Date: 5 / 27 / 05 (MM DD YY) Reviewed by: GTC Date: 6 / 2 / 05 (MM DD YY)

Client: BRC Project: BRC CAMU Project No.: SC0313 Task No. 01-02

$$FS = \frac{\tan\phi}{\tan\beta} \qquad \text{(Equation 2)}$$

For the proposed slopes, the inclination is 2.1H:1V, therefore the factor of safety is:

$$FS = \frac{\tan 35}{1/2.1} = 1.47$$

CONCLUSIONS

- The minimum factor of safety for the proposed cut slopes (2.1H:1V) is 1.46;
- The undrained shear strength of the CL layer can be characterized with a c/p ratio of 0.24 and a unit weight of 102 pcf; and
- The shear strength of the SM material can be conservatively characterized as c'=0 and ϕ'=35 degrees and a unit weight of 117 pcf.

Direct Shear Strength

A progressive direct shear test was performed on selected undisturbed samples using a constant strain rate direct shear machine in general accordance with ASTM D3080. The test specimen was trimmed and placed in the shear machine, a specified normal load was applied, and the specimen was sheared until maximum shear strength was developed. After the soil specimen had developed maximum shear resistance under the first normal load, the normal load was removed and the specimen was pushed back to its original undeformed configuration. Another normal load was then applied, and the specimen was sheared a second time. This process was repeated for three different normal loads. Results of the direct shear test are presented on Figures A-62 through A-69 and in the following table:

Exploration Location	Depth (feet)	Soil Description	Angle of Internal Friction (deg)	Coulomb Cohesion (ksf)
B-4	14-14.5	Silty sand with gravel	31	0.7
B-5	14-15	Silty sand with gravel	43	0.3
B-10	54-54.5	Sandy lean clay	26	0.85
B-12	14-15	Silty sand with gravel	40	0.3
B-101	39-40	Sandy lean clay	26	0.9
B-102	20-25	Silty sand with gravel	37	0.2
B-103	49-50	Sandy lean clay	37	1.0
B-104	10-15	Silty sand with gravel	43	0.1

Chemical Analysis

Chemical tests were performed on a representative soil samples to investigate the potential for soil corrosivity and chemical heave. Atlas Chemical Testing Laboratories, Inc. in Las Vegas performed the chemical analysis for water-soluble sulfates and sodium in general accordance with ASTM D516. The results of the chemical tests are presented on Drawing No. A-70.

GTC MLD

Grain Size Distribution

Grain size distribution for soil samples were determined by sieve analysis in accordance with ASTM C136. A sieve analysis is conducted by passing the soil through a number of different sized sieves and measuring the amount of soils retained on each sieve. The test results and grain size distribution curves are presented on Drawing Nos. A-37 through A-48.

Atterberg Limits

The liquid limit, plastic limit and plasticity index of a representative sample of the fine-grained soils were determined to aid in the classification of the soils and in the evaluation of other engineering parameters. The test was performed in general accordance with ASTM test method D4318. The results of the tests are tabulated in the following table:

Exploration Location	Sample Depth, ft.	Liquid Limit, %	Plastic Limit, %	Plasticity Index	Unified Soils Classification
B-1	30-35	NP	NP	NP	SM
B-5	20-25	NP	NP	NP	SM

SUMMARY OF SUBSURFACE CONDITIONS

This log is part of the report prepared by Converse for this project and should be read with the report. This summary applies only at the location and time of the exploration. Subsurface conditions may differ at other locations and may change at this location with the passage of time. The data presented is a simplified model of the actual conditions encountered.

Depth (ft)	Graphic Log		Samples: Drive	Samples: Bulk	Blow Count	Drill Rate (sec/ft)	Moisture (%)	Dry Density (lb/cf)	Field or Lab Tests

1 PIEZOMETRIC SURFACE(S) HAVE BEEN SPECIFIED

Unit Weight of Water = 62.40

Piezometric Surface No. 1 Specified by 2 Coordinate Points

Point No.	X-Water (ft)	Y-Water (ft)
1	.00	122.00
2	450.00	127.00

A Critical Failure Surface Searching Method, Using A Random Technique For Generating Circular Surfaces, Has Been Specified.

2000 Trial Surfaces Have Been Generated.

10 Surfaces Initiate From Each Of200 Points Equally Spaced Along The Ground Surface Between X = 235.00 ft.
and X = 250.00 ft.

Each Surface Terminates Between X = 333.00 ft.
and X = 375.00 ft.

Unless Further Limitations Were Imposed, The Minimum Elevation At Which A Surface Extends Is Y = .00 ft.

11.00 ft. Line Segments Define Each Trial Failure Surface.

Following Are Displayed The Ten Most Critical Of The Trial Failure Surfaces Examined. They Are Ordered - Most Critical First.

* * Safety Factors Are Calculated By The Modified Janbu Method * *

1 PIEZOMETRIC SURFACE(S) HAVE BEEN SPECIFIED

Unit Weight of Water = 62.40

Piezometric Surface No. 1 Specified by 2 Coordinate Points

Point No.	X-Water (ft)	Y-Water (ft)
1	.00	122.00
2	450.00	127.00

A Critical Failure Surface Searching Method, Using A Random Technique For Generating Circular Surfaces, Has Been Specified.

2000 Trial Surfaces Have Been Generated.

10 Surfaces Initiate From Each Of200 Points Equally Spaced Along The Ground Surface Between X = 200.00 ft.
and X = 250.00 ft.

Each Surface Terminates Between X = 400.00 ft.
and X = 450.00 ft.

Unless Further Limitations Were Imposed, The Minimum Elevation At Which A Surface Extends Is Y = .00 ft.

11.00 ft. Line Segments Define Each Trial Failure Surface.

Following Are Displayed The Ten Most Critical Of The Trial Failure Surfaces Examined. They Are Ordered - Most Critical First.

* * Safety Factors Are Calculated By The Modified Janbu Method * *

stresses associated with failure. As the number of tests increases indefinitely, it is apparent that the envelope of the failure circles (Fig. 4.6*a*) represents the locus of points associated with failure of the specimens. The envelope is known as the *rupture line* for the given material under the specific conditions of the series of tests. For materials in general, the rupture line may be curved, and it may have an intercept c on the axis of shearing stress. Since the values of shearing strength t corresponding to the rupture line all represent failure, they are designated as values of shearing strength s, and the vertical axis in Fig. 4.6*a* is called the axis of shearing strength. If the rupture line is considered to be straight, it may be represented by

$$s = c + p \tan \phi \qquad 4.2$$

known as *Coulomb's equation*.

From the geometry of Fig. 4.6*b*, it may be seen that for any failure circle

$$2\alpha = 90^\circ + \phi$$

Therefore, the angle between the planes on which failure occurs and the plane on which the major principal stress acts is

$$\alpha = 45^\circ + \frac{\phi}{2} \qquad 4.3$$

4.6. Shearing Strength of Dry Sands and Gravels

The rupture lines for dry sands and gravels pass through the origin of the rupture diagram; hence, the intercept c is equal to zero. If the material is in a loose state, the rupture line is linear and may be represented accurately by the equation

$$s = p \tan \phi_d \qquad 4.4$$

where ϕ_d is the angle between the rupture line and the p-axis. For the same materials in a dense state, the rupture line has a slight downward curvature, but for practical purposes in foundation engineering it may also be represented by eq. 4.4.

For gravels, sands, silty sands, and inorganic cohesionless silts the value of ϕ_d depends primarily on the relative density, the grain-size distribution, and the shape of the grains. It may be estimated with the aid of Table 4.1.

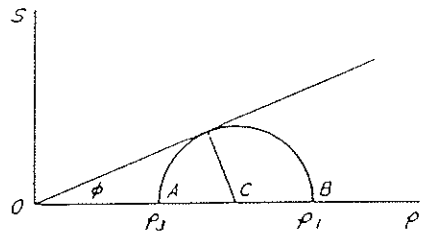
Table 4.1 Representative Values of ϕ_d for Sands and Silts

Material	Degrees	
	Loose	Dense
Sand, round grains, uniform	27.5	34
Sand, angular grains, well graded	33	45
Sandy gravel	35	50
Silty sand	27–33	30–35
Inorganic silt	27–30	30–34

ILLUSTRATIVE PROBLEM

A drained triaxial test is to be performed on a uniform dense sand with rounded grains. The all-around pressure p_3 is to be 2 tons/sq ft. At about what vertical pressure should the sample fail?

Solution. If $s = p \tan \phi$, it can be seen from the sketch that



$$\frac{p_1}{p_3} = \frac{OC + CB}{OC - AC} = \frac{OC + OC \sin \phi}{OC - OC \sin \phi}$$

$$= \frac{1 + \sin \phi}{1 - \sin \phi}$$

Whence by trigonometric transformation

$$\frac{p_1}{p_3} = \tan^2\left(45^\circ + \frac{\phi}{2}\right) = \frac{1}{\tan^2[45^\circ - (\phi/2)]}$$

According to Table 4.1, the value of ϕ_d is likely to be about 34°. Therefore,

$$\tan^2\left(45^\circ + \frac{\phi_d}{2}\right) = \tan^2(45^\circ + 17^\circ)$$

$$= 1.881^2 = 3.54$$

SLOPE STABILITY EVALUATION
FINAL WASTE SLOPES
BRC CAMU

OBJECTIVE

The objective of this calculation package is to evaluate the stability of the final waste soil slopes of the BRC Corrective Action Management Unit (CAMU) located in Henderson, Nevada.

APPROACH OF ANALYSES

One of the important aspects in performing slope stability analyses is the selection of appropriate material parameters. With respect to landfill design, experience dictates that the weakest materials are typically the geosynthetic materials of the composite liner system. Hence, selection of material parameters for the composite liner system, specifically internal and interface shear strength properties are typically the most critical.

Ideally, lining shear strength properties should be determined from the results of laboratory testing conducted on site specific lining materials. In lieu of conducting a laboratory testing program with site specific materials, material shear strength properties may be adopted from values reported in literature or values gained from experience. However, shear strength properties are dependent on the laboratory testing conditions (e.g. confining pressures, shearing rate, degree of saturation). In addition, published material shear strength properties may be very general or explicitly product specific. Subsequently, employing published or experience-based shear strength parameters in slope stability analyses may require that restrictions be placed on the actual products and specific application conditions to ensure that the constructed slope is representative of the slope evaluated in stability analyses.

To minimize the restrictions placed on the actual products used and the specific application condition of the products in the construction of the BRC CAMU, the slope stability analyses presented herein were conducted using the following approach:

1. Determine the minimum shear strength parameters (internal or interface) of the composite liner components satisfying design criteria as indicated by results of slope stability analyses (i.e. back-analysis);

Written by: Meghan Lithgow Date: 08 / 06 / 06 (MM DD YY) Reviewed by: [illegible] Date: 11 / 03 / 06 (MM DD YY)

Client: BRC Project: BRC CAMU Project No.: SC0313 Task No.: 01 -02

2. Demonstrate, using shear strength values reported in literature, that commercially available products exist which reportedly satisfy the minimum shear strength parameters; and
3. Based on the minimum shear strength parameters and shear strength values reported in literature, develop specific requirements for the composite liner system components which must be satisfied as demonstrated through results of laboratory testing of site specific materials to be included in the Technical Specifications.

DESIGN CRITERION

In current practice, a static factor of safety of 1.5 is generally required for final refuse slopes. To evaluate static stability at the BRC CAMU, GeoSyntec established a minimum static factor of safety of 1.5 as the stability criteria.

METHOD OF ANALYSIS

The slope stability computer program SLOPE/W (GeoStudio, 2006) was employed for this analysis. SLOPE/W employs limit equilibrium principles to provide general solutions to slope stability problems for a variety of slip surface shapes, pore-water pressure conditions, soil properties, analysis methods, and loading conditions. Potential sliding surfaces, both circular and polygonal, can be specified or randomly generated.

CROSS SECTIONS

Two cross sections were developed (cross sections A-A' and B-B') to evaluate stability of the waste soil slopes of the BRC CAMU. The locations of these cross sections are indicated in Figure 1. The cross sections were selected and developed considering that the most likely potential failure surfaces would propagate along the composite liner system. In addition, the slopes with the largest heights were chosen to represent the most critical conditions. Cross sections A-A' and B-B' are representative of approximately a 2% liner slope behind a 3H:1V (horizontal:vertical) 47-ft high slope of cover soil.

The slope stability calculations are based on the conceptual design grading plans developed by GeoSyntec. Additional calculations may have to be performed if changes are made to the aforementioned design grading plans.

MATERIAL PARAMETERS

In order to determine the critical material parameters of the composite liner system through back-analyses, it is necessary to establish the material parameters for non-liner system components of the slope configurations. Non-liner system components involved in the evaluation of waste soil stability include waste soil and native geologic materials. The selection of material parameters for the non-liner system components used for slope stability analyses are presented herein.

Waste Soil Material

For the purposes herein, the waste soil material is assumed to be similar to soils located at the BRC CAMU site. The *in situ* properties determined by Converse (1999) characterize the BRC CAMU site soils as alluvial granular soils overlying fine-grained soils encountered at depths from approximately 34-ft to 55-ft below the surface. Based on Converse (1999) the alluvial granular soils are classified as silty sand with gravel (SM). The fine-grained soils are classified as sandy lean clay (CL). Therefore, it is assumed that the waste soil can be classified as a silty sand with gravel (SM). A sample boring log is presented in Attachment 1 to represent the typical subsurface profile.

Direct shear tests were preformed on retrieved samples by Converse (1999). The *in situ* material properties evaluated by Converse (1999) are presented in Attachment 2. Based on results by Converse (1999) the silty sand with gravel is assumed to have a friction angle of 40 degrees and cohesion of 300 psf. For this analysis, GeoSyntec assumes a friction angle equal to 31 degrees and a cohesion of 300 psf.

Written by: Meghan Lithgow Date: 08 / 06 / 06 (MM DD YY) Reviewed by: GTC Date: 11 / 3 / 06 (MM DD YY)

Client: BRC Project: BRC CAMU Project No.: SC0313 Task No.: 01-02

Converse reported a maximum dry density of 132 pcf and an optimum water content of 8.7 percent for materials at the site. Therefore, assuming 95% relative compaction, the dry density in the field is approximately 125 pcf. Adding the weight of water, the unit weight is approximately 136 pcf.

Native Material

Native material within the limits of the BRC CAMU consists of alluvial granular soils overlying fine-grained soils. Shear strength parameters for the native soil material were previously estimated and reported in the *Preliminary Geotechnical and Geologic Investigation - Industrial Non-Hazardous Disposal Facility* (Converse 1999). Twelve exploratory borings were conducted by others to depths ranging from 33-ft to 60-ft (Converse 1999). In general, the native materials appear to be consistent between borings. Direct Shear tests were performed on selected undisturbed samples retrieved from the exploratory borings. A summary of the Direct Shear test results as reported by Converse (1999) is presented in Attachment 2.

GeoSyntec performed stability calculations for the proposed fill slopes at the BRC CAMU. Fill slope stability calculations are presented in Appendix X, "*Slope Stability Evaluation - Fill Slopes*".

RESULTS OF ANALYSES

Stability analyses were conducted on cross sections A-A' and B-B' using the computer program SLOPE/W. Because the composite liner system of solid waste landfills introduces the weakest materials within a typical cross section, polygonal or wedge shaped potential failure surfaces propagating along the composite liner system were investigated. Potential wedge failure surfaces were evaluated using the solver function of the SLOPE/W program to search for the lowest factor of safety using both force and moment analyses. The locations of potential failure surface searches were varied throughout the cross section by the user to focus on the location of the most critical potential failure surface (defined as the potential failure surface yielding the lowest factor of safety) for the given cross section.

A composite liner system represented by an apparent friction angle of 12 degrees and no geosynthetic adhesion yields a factor of safety of 1.7 for the most critical potential failure surface of cross section A-A' and 1.6 for cross section B-B' (Attachment 3).

REVIEW OF MATERIAL SHEAR STRENGTHS REPORTED IN LITERATURE

Results of the stability analyses indicate that the minimum allowable apparent internal or interface friction angle for components of the composite liner system is 12 degrees. The objective herein is to identify the potential internal and interface sliding surfaces of the composite liner system proposed for the BRC CAMU and to estimate potential values of internal and interface friction angles based on values reported in literature. The proposed base and side slope composite liner system is comprised of, from top to bottom:

- 2 ft. thick operations layer;
- Drainage geocomposite with an 8 oz/sy geotextile bonded to both sides of the geonet;
- 60 mil HDPE geomembrane liner (textured top and bottom);
- Geosynthetic clay liner (GCL); and
- Prepared subgrade or waste soil.

The estimated internal and/or interface shear strengths for each of the potential composite liner system materials as reported in literature and the corresponding reference are presented below. Values listed below, unless otherwise noted, represent post-peak or residual friction angles.

The type of GCL considered is a geotextile-backed GCL. The geotextile-backed GCL consists of a layer of bentonite between two geotextiles.

The following presents a summary of published interface friction values:

Material/Interface	c', Friction Angle[1]	Reference
-Operations layer	0, 32 degrees	NAVFAC (1982) (Att. 4)[2,3]
-Operations layer/GT	0, 29 degrees	Koerner (1995) (Att. 5)[4]
-GT/leachate collection aggregate	0, 34 degrees	Koerner (1995) (Att. 5)[4,5]
-Leachate collection aggregate	0, 37 degrees	NAVFAC (1982) (Att. 4)[2,5]
-Geotextile/textured GM	0, 19 degrees	Li and Gilbert (1999) (Att. 7)[6]
-Textured GM/GCL	0, 12 degrees	Bentomat (Att. 6)[8]
-GCL (internal)	0, 16 degrees	Bentomat (Att. 6)[7]
-GCL (GT backed)/subgrade	0, 31 degrees	Bentomat (Att. 6)[8]
-Prepared Subgrade	0, 35 degrees	Converse (1999) (Att. 2)

where:
GT = geotextile
GM = geomembrane
GCL = geosynthetic clay liner

Notes:

1. For the sake of comparison herein, the adhesion of the geosynthetic interfaces (geosynthetic cohesion) is neglected. All values are presented in terms of effective stress strength parameters.

2. NAVFAC (1982) lists typical shear strength values for various soils based on 100 percent standard Proctor compaction. Actual construction materials would likely be placed at 90 percent of the modified Proctor compaction which for the sake of the comparison presented herein roughly corresponds to 100 percent standard Proctor compaction.

3. Value of friction angle for a silty sand designated under the USCS classification system as a SM.

4. Koerner (1995) suggests that an efficiency of greater than 90 percent for the interface of nonwoven, needle-punched geotextiles to various soils can be achieved. Efficiency values are based on the relationship, Efficiency = tan(interface friction angle)/tan(soil friction angle). The interface friction angle presented herein was calculated using a 90 percent efficiency and the estimated soil friction angle. Adhesion is neglected.

5. Value of friction angle for a well graded or poorly graded gravel designated under the USCS classification system as a GW or GP.

Client: BRC Project: BRC CAMU Project No.: SC0313 Task No.: 01-02

6. Li and Gilbert (1999) reports an average secant friction angle of a Gundline HDT 60-mil HDPE geomembrane/Trivira 1145 interface of 19 degrees under a confining pressure of 50 psi at a large-displacement (Attachment 8).

7. According to the Summary of Bentomat Direct Shear Test Data (Attachment 6) a friction angle of 24 degrees is represents typical reported peak displacement internal shear strength values for the GCLs. Note that this represents typical results of hydrated test conditions within the range of normal stresses from 14 to 142 psi. The peak displacement internal shear strength equals approximately 16 degrees when reduced by a factor of safety of 1.5. This reduction in the internal shear strength is conservative considered in the absence of site specific test data.

8. Reported data from the Summary of Bentomat Direct Shear Test Data (Attachment 6). Note that this represents typical results of hydrated test conditions within the range of normal stresses from 7.5 to 30 psi for the respective interface.

CONCLUSIONS

Results of stability analyses presented herein indicate that an apparent internal or interface friction angle (residual) of 12 degrees for any component of the composite liner system is the minimum allowable value providing for a static factor of safety that satisfies the design criteria of 1.5.

A review of potential internal and interface shear strengths reported in literature for materials representative of the components of the proposed composite liner system at the BRC CAMU was conducted. Based on the shear strength values reported in literature, proposed composite liner interfaces exhibit apparent internal and interface friction angles greater than the minimum allowable value of 12 degrees evaluated herein.

Furthermore, it is crucial that interface shear tests be conducted on the actual materials proposed for use in the composite liner system. Based on the analyses presented herein, results of interface shear tests on the actual materials proposed for use in the composite liner system must indicate that the weakest **apparent residual friction angle** of the composite liner system is equal to or greater than 12 degrees. Note that the **apparent friction angle** differs from the friction angle determined from the failure envelope developed directly from results of direct shear tests. The **apparent friction angle** is determined from the failure envelope of the data points from direct shear test results which have been linearly regressed through the origin of the normal stress/shear stress plot.

Written by: Meghan Lithgow Date: 08 / 06 / 06 (MM DD YY) Reviewed by: GC Date: 11 / 3 / 06 (MM DD YY)

Client: BRC Project: BRC CAMU Project No.: SC0313 Task No.: 01 -02

The results of interface shear testing are directly dependent on the test conditions including normal stress levels, rate of shear, degree of saturation, and amount of displacement. It is imperative that these test conditions are representative of the anticipated conditions at the BRC CAMU when testing actual materials proposed for use in the composite liner system.

Direct Shear Strength

A progressive direct shear test was performed on selected undisturbed samples using a constant strain rate direct shear machine in general accordance with ASTM D3080. The test specimen was trimmed and placed in the shear machine, a specified normal load was applied, and the specimen was sheared until maximum shear strength was developed. After the soil specimen had developed maximum shear resistance under the first normal load, the normal load was removed and the specimen was pushed back to its original undeformed configuration. Another normal load was then applied, and the specimen was sheared a second time. This process was repeated for three different normal loads. Results of the direct shear test are presented on Figures A-62 through A-69 and in the following table:

Exploration Location	Depth (Feet)	Soil Description	Angle of Internal Friction (deg)	Coulomb Cohesion (ksf)
B-4	14-14.5	Silty sand with gravel	31	0.7
B-5	14-15	Silty sand with gravel	43	0.3

Grain Size Distribution

Grain size distribution for soil samples were determined by sieve analysis in accordance with ASTM C136. A sieve analysis is conducted by passing the soil through a number of different sized sieves and measuring the amount of soils retained on each sieve. The test results and grain size distribution curves are presented on Drawing Nos. A-37 through A-48.

Atterberg Limits

The liquid limit, plastic limit and plasticity index of a representative sample of the fine-grained soils were determined to aid in the classification of the soils and in the evaluation of other engineering parameters. The test was performed in general accordance with ASTM test method D4318. The results of the tests are tabulated in the following table:

Exploration Location	Sample Depth, ft.	Liquid Limit, %	Plastic Limit, %	Plasticity Index	Unified Soils Classification
B-1	30-35	NP	NP	NP	SM

stresses associated with failure. As the number of tests increases indefinitely, it is apparent that the envelope of the failure circles (Fig. 4.6*a*) represents the locus of points associated with failure of the specimens. The envelope is known as the *rupture line* for the given material under the specific conditions of the series of tests. For materials in general, the rupture line may be curved, and it may have an intercept c on the axis of shearing stress. Since the values of shearing strength t corresponding to the rupture line all represent failure, they are designated as values of shearing strength s, and the vertical axis in Fig. 4.6*a* is called the axis of shearing strength. If the rupture line is considered to be straight, it may be represented by

$$s = c + p \tan \phi \qquad 4.2$$

known as *Coulomb's equation.*

From the geometry of Fig. 4.6*b*, it may be seen that for any failure circle

$$2\alpha = 90° + \phi$$

Therefore, the angle between the planes on which failure occurs and the plane on which the major principal stress acts is

$$\alpha = 45° + \frac{\phi}{2} \qquad 4.3$$

4.6. Shearing Strength of Dry Sands and Gravels

The rupture lines for dry sands and gravels pass through the origin of the rupture diagram; hence, the intercept c is equal to zero. If the material is in a loose state, the rupture line is linear and may be represented accurately by the equation

$$s = p \tan \phi_d \qquad 4.4$$

where ϕ_d is the angle between the rupture line and the p-axis. For the same materials in a dense state, the rupture line has a slight downward curvature, but for practical purposes in foundation engineering it may also be represented by eq. 4.4.

For gravels, sands, silty sands, and inorganic cohesionless silts the value of ϕ_d depends primarily on the relative density, the grain-size distribution, and the shape of the grains. It may be estimated with the aid of Table 4.1.

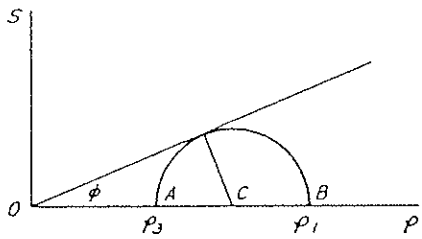
Table 4.1 Representative Values of ϕ_d for Sands and Silts

Material	Degrees	
	Loose	Dense
Sand, round grains, uniform	27.5	34
Sand, angular grains, well graded	33	45
Sandy gravel	35	50
Silty sand	27–33	30–35
Inorganic silt	27–30	30–34

ILLUSTRATIVE PROBLEM

A drained triaxial test is to be performed on a uniform dense sand with rounded grains. The all-around pressure p_3 is to be 2 tons/sq ft. At about what vertical pressure should the sample fail?

Solution. If $s = p \tan \phi$, it can be seen from the sketch that



$$\frac{p_1}{p_3} = \frac{OC + CB}{OC - AC} = \frac{OC + OC \sin \phi}{OC - OC \sin \phi}$$

$$= \frac{1 + \sin \phi}{1 - \sin \phi}$$

Whence by trigonometric transformation

$$\frac{p_1}{p_3} = \tan^2\left(45° + \frac{\phi}{2}\right) = \frac{1}{\tan^2 [45° - (\phi/2)]}$$

According to Table 4.1, the value of ϕ_d is likely to be about 34°. Therefore,

$$\tan^2\left(45° + \frac{\phi_d}{2}\right) = \tan^2 (45° + 17°)$$

$$= 1.881^2 = 3.54$$

DRAINAGE PIPE SIZE REQUIREMENTS

OBJECTIVE

The objective of this calculation package is to evaluate the drainage pipe size requirements for the base liner proposed for the drainage system for the BRC Corrective Action Management Unit (CAMU) located in Henderson, Nevada. It is proposed that the drainage system include an geocomposite drainage layer with a single drainage pipe, bedded in a drainage aggregate trench, located along the base of each cell. The pipe diameter and perforations must be able to handle the maximum flow into and through the pipe. This calculation will evaluate the required performance diameter and perforation size and spacing for the drainage pipe. In addition, the drainage aggregate must be sized as to not allow transport of materials through the pipe perforations.

SUMMARY OF ANALYSIS

The calculations suggest that a 4-inch diameter pipe with four ¼-inch perforations spaced at 1 foot on center will accommodate the maximum flow predicted by the HELP Model. The maximum particle size of the drainage aggregate is 1 in or less (as evaluated in the geomembrane puncture protection calculation) and D_{85} must be 0.5 inch or higher to prevent piping and material loss. AASHTO 67 material meets the drainage aggregate requirements.

SITE CONDITIONS

The proposed composite liner system will be comprised of the following components, from top to bottom (Figure 2):

- 2 ft of operations layer material;
- a drainage geocomposite;
- 60-mil (1.5 mm) HDPE geomembrane, textured on both sides;
- a geosynthetic clay liner (GCL); and
- prepared subgrade.

ANALYSIS

HELP Analyses:

The Hydrologic Evaluation of Landfill Performance (HELP) model was used to estimate the peak daily quantity of liquid expected to be generated in the drainage pipe during or after a rainfall event. The HELP model is used to evaluate the worst case scenario which occurs *during the period when the cell contains a small quantity of waste*, such that any collected liquid is considered leachate, yet the majority of the cell is empty so the largest quantity of liquid will infiltrate through the operations layer to the drainage layer. This time period exists between the following activities:

- *Immediately after the composite liner system construction has been completed* (any collected liquid during construction is considered construction water and will not be contaminated);

- *Before the period of significant waste placement.* Leachate generation is reduced by the dry landfill moisture retention capacity. Separate calculation packages address the moisture retention capacity of the dry landfill soil and respective dry landfill requirements so that leachate generation is greatly reduced or completely stored in the waste soil.

No further analyses are needed because the above condition represents the worst case during the life of the landfill.

The rainfall history was synthetically generated by HELP over a 20 year period. The drainage pipes, pipe perforations, and portions of the drainage geocomposite layer (maintaining less than 1 ft of head over the liner) must accommodate the peak daily quantity over a 20 year rainfall history. This is conservative because the 20-year peak daily quantity is assumed to occur during a relatively short exposure period.

The initial water content of the placed soil is assumed to be the default water content initialized by HELP. This is conservative because the water content of the drainage aggregate and operations layer soil is likely to be relatively low due to high temperatures and low humidity at the site, creating a high pan evaporation rate. Therefore, the initial water content evaluated by HELP (based on a water content near steady state) will likely be higher than the actual site conditions.

Model Parameters

Vertical Percolation Layer: The vertical percolation layer (type 1) is represented by default properties for a silty sand in HELP (texture number 3). However, the hydraulic conductivity is changed to represent worst case (high hydraulic conductivity) as estimated by Converse Consultants (Attachment G).

Geocomposite: The default material properties for the drainage geocomposite in the HELP model are used to represent the lateral drainage layer (type 2). The defalt properties for the geocomposite are represented by HELP texture number 20. The hydraulic conductivity of the goecomposite is assumed to be 10 cm/sec (required by 40 CFR 264.301 (c) (3) (ii)).

Geosynthetics: The geomembrane and GCL properties are estimated from the HELP model. The GCL is represented by texture number 17 and the geomembrane is represented by texture number 35.

Runoff: The SCS runoff curve number was evaluated assuming HELP texture number 3 at the surface (silty sand).

The default values in the HELP model are shown in the HELP output presented in Attachment A.

Figure 1 presents the locations of drainage pipes and HELP Model analyses listen in the following Table. Figure 2 shows the cross section of the base liner system.

HELP Results

The following results were obtained from the HELP analysis:

Location	Peak Daily Quantity	Area	Slope and Length[1]	File
Unit 1	306 ft^3	3.34 acres	2% and 200 ft	SOIL1SUM
Unit 2	568 ft^3	5.98 acres	2% and 400 ft	SOIL2SUM
Unit 3	1062 ft^3	10.9 acres	2% and 1050 ft	SOIL3SUM
Unit 4	1169 ft^3	11.9 acres	3% and 550 ft	SOIL4SUM
Unit 5	1313 ft^3	13.3 acres	3% and 650 ft	SOIL5SUM
Unit A	9833 ft^3	2.84 acres	48% and 100 ft	SOILASUM
Unit B	10471 ft^3	3.15 acres	48% and 75 ft	SOILBSUM

Pipe Diameter Analysis

From the HELP Model analyses performed for each of the 5 units and 2 side slope conditions at this facility (Attachment A), the maximum peak daily quantity of liquid expected to be generated is 10457 cubic feet on Slope B (see Figure 1). Two pipes will be used to convey the drainage from Slopes B to the sump. The following flow rate for each pipe is calculated:

(10457 CF/day) / (24 hours/day) / (60 min/hour) / (60 sec/min)/2 = 0.0605 cfs

The following equation (Attachment B) can be used to estimate the flow rate in the pipe when flowing full:

$Q_{½\ full} = (1.486/n)(A)(R)^{2/3}(S)^{1/2}$
where;
n = the Mannings roughness coefficient, 0.009 for plastic pipe (Attachment B)
A = the area of the pipe
R = hydraulic radius = area/perimeter of the pipe (Attachment B)
S = minimum slope of pipe = 0.5 %

Assuming a 4" diameter pipe will be sufficient, and using the standard dimension ratio (SDR) of 13.5 determined in the pipe crushing calculation, the following values will be used in the above equation:

r = 1.92 in (SDR 13.5 HDPE pipe) (Attachment ~~A~~ C)
$A = \pi r^2 = \pi (1.92/12)^2 = 0.080\ ft^2$
$R = (0.080) / (2 \pi (1.92/12)) = 0.080$ ft

Placing the above values into the Mannings equation results in the following:

$Q_{½\ full} = (1.486/0.009)(0.080)(0.080)^{2/3}(.005)^{1/2}$

$Q_{½\ full}$ = 0.173 cfs, which is larger than the required flow rate of 0.061 cfs, therefore 4" diameter pipe will be sufficient for this application.

Perforations Analysis

A minimum of four penetrations, each 45 and 90 degrees from the bottom of the pipe, will be used to limit the amount of particulates entering the drainage pipe directly. Verify that 4 rows of ¼-inch holes spaced at 12 inches on center are adequate.

Written by: Rebecca Flynn Date: 06/08/29 (YY/MM/DD) Reviewed by: [illegible] Date: 06/11/3 (YY/MM/DD)

Client: BRC Project: BRC CAMU Project/Proposal No.: SC0313 Task No.: 01-04

The holes will be modeled as submerged orifices using the following equation:

$Q = C_d A (2gh)^{1/2}$ (Attachment D)

where:

C_d = coefficient of discharge = 0.62 (Attachment D)

A = area of hole = $\pi (0.125/12)^2 = 0.0003$ ft^2

h = head in feet = 1 ft based on maximum head allowed over the liner system

g = gravity = 32.2 ft/sec^2

$Q = (0.62) (0.0003) (2 \times 32.2 \times 1)^{1/2} = 0.0015$ cfs per hole

Q = 0.0015 cfs x 4 holes/foot of pipe = 0.006 cfs per foot of pipe

The conservative maximum discharge to the pipe is approximately 0.061 cfs. Since there is more than 100 ft of drainage pipe for each unit (6.1 cfs/100 ft of pipe) the perforation size and spacing is more than adequate for the predicted flow rates to the pipe.

Required Drainage Aggregate

The size of the perforations are 1/4 inch in diameter. The gradation of the drainage aggregate must be designed to insure that piping and material loss will not occur. The U.S. Bureau of Reclamation (1973) use the following criteria for gradation of filter materials in relation to holes:

(D_{85} of the filter material) / (hole diameter) > 2.0 (Attachment E)

Therefore, D_{85} of the filter material must be greater than 1/2 inch.

AASHTO 67 material has a maximum particle size of 1 inch, which is the criteria for puncture protection of the geomembrane. D_{85} of AASHTO 67 material ranges from approximately 0.5 to 0.7 inches, which satisfies the above criteria (see Attachment F).

CONCLUSIONS

In accordance with the above analysis, the drainage pipe shall be 4-inch diameter pipe with four ¼-inch perforations per foot of pipe. The drainage aggregate shall have a hydraulic conductivity greater than 1 x 10^{-2} cm/sec, a maximum particle diameter of 1 inch, and D_{85} greater than 1/2 inch. AASHTO 67 material satisfies this criteria.

Table VI Values of n for use with Manning Equation

Surface	n, Range	n, design
Polyethylene pipe	0.008-0.011	0.009 *
Uncoated cast or ductile iron pipe	0.012-0.015	0.013
Corrugated steel pipe	0.021-0.030	0.024
Concrete pipe	0.012-0.016	0.015
Vitrified clay pipe	0.011-0.017	0.013
Brick & cement mortar sewers	0.012-0.017	0.015
Wood stave	0.010-0.013	0.011
Rubble masonry	0.017-0.030	0.021

Some gravity flow piping systems may become very complex, especially if the pipeline grade varies, because friction loss will vary along the run. With a varying grade, parts of the line may develop internal pressure, or vacuum, and may have varying liquid levels in the bore.

Manning

For open channel water flow under conditions of constant grade, and uniform channel cross section, the Manning equation may be used. Open channel flow exists in a pipe when it runs partially full. Like the Hazen-Williams formula, the Manning equation is limited to water or liquids with a kinematic viscosity equal to water.

Manning Equation (20)

$$V = \frac{1.486}{n} r^{2/3} S^{1/2}$$

where

V = flow velocity, ft/sec
n = roughness coefficient, dimensionless
r = hydraulic radius, ft

$$r = \frac{A}{P} \quad * \quad (21)$$

A = channel cross section area, ft^2
P = perimeter wetted by flow, ft
S = hydraulic slope, ft/ft

$$S = \frac{h_1 - h_2}{L} = \frac{h_f}{L} \quad (22)$$

h_1 = upstream pipe elevation, ft
h_2 = downstream pipe elevation, ft
h_f = friction loss, ft of liquid

It is convenient to combine the Manning equation with

$$Q = A V \quad (23)$$

to obtain

$$Q = \frac{1.486A}{n} r^{2/3} S^{1/2} \quad * \quad (24)$$

where terms are as defined above, and

Q = flow, ft^3/secWhen a circular pipe is running full or half-full,

$$r = \frac{D}{4} - \frac{d}{48} \quad (25)$$

verts.

an entrance loss, h_{ent}, friction loss, h_f, and the
barrel.

$$h_L = h_{ent} + h_f + \frac{V^2}{2g}$$

Substituting Equations (3.32) and (3.16) for h_{ent} and h_f, respectively, we have

$$h_L = k_{ent}\left(\frac{V^2}{2g}\right) + \frac{n^2V^2L}{R_h^{4/3}} + \frac{V^2}{2g} \tag{8.17}$$

The entrance coefficient, k_{ent}, is approximately 0.5 for a square-edged entrance and approximately 0.1 for a well-rounded entrance. Common values used for the Manning's roughness coefficient are $n = 0.012$ for concrete pipe and $n = 0.024$ for corrugated steel pipe. Equation (8.17) may be rearranged to express the direct relationship between the discharge and the dimensions of the culvert at any given elevation difference, h_L, between tail water and head water. For a circular culvert,

$$h_L = \left[K_{ent} + \left(\frac{n^2L}{R_h^{4/3}}\right)(2g) + 1\right]\frac{8Q^2}{\pi^2gD^4} \tag{8.18}$$

where Q is the discharge, D is the diameter, and R_h is the hydraulic radius ($R_h = D/4$) of the culvert barrel. For culverts with noncircular cross sections, the head loss may be calculated by Equation (8.17) with the corresponding hydraulic radius calculated by using the cross-sectional area, A, and the wetted perimeter, P.

2. If the discharge carried in a culvert has a normal depth that is larger than the barrel height, the culvert will flow full even if the tail water level drops below that of the outlet. In this case, the discharge is controlled by the head loss and the level of the head water (HW). The hydraulics are the same as discussed before.
3. If the normal depth is less than the barrel height, with the inlet submerged and free discharge at the outlet, a partially full pipe flow condition will normally result, as illustrated in Figure 8.17(c). The culvert discharge is controlled by the entrance condition, and the flow is said to be under *entrance* control. The discharge can be calculated by

$$Q = C_dA\sqrt{2gh} \tag{8.19}$$

where h is the hydrostatic head above the center of the orifice and A is the cross-sectional area. C_d is the coefficient of discharge; common

HWANG "FUNDAMENTALS OF HYDRAULIC ENGINEERING SYSTEMS"
2nd EDITION, PRENTICE-HALL, 1987

ATTACHMENT D 1/2

values used in practice are $C_d = 0.62$ for a square-edged entrance and $C_d = 1.0$ for a well-rounded entrance.

4. When the hydrostatic head at the entrance is less than $1.2D$, air will break into the barrel and the culvert will flow under no pressure. In this case, the culvert slope and the barrel wall friction determine the flow condition in the culvert for open channel flow. Due to a sudden reduction of the water area at the entrance, the flow usually enters the culvert in a supercritical condition. The critical depth takes place at the entrance of the barrel. The friction of the barrel wall gradually dissipates the energy. If the rate of dissipation is higher than the flow could gain from the barrel slope, the depth of the flowing water will increase in the downstream direction. Depending on the tail water level, the supercritical flow may convert to subcritical flow through a hydraulic jump. The flow conditions can be computed by applying the water surface profiles developed for open channels.

Example 8.4

A corrugated steel pipe is used as a culvert that must carry a flow rate of 5.3 m^3/sec and discharge into the air. At the entrance, the maximum available water head is 3.2 m above the bottom as shown in Figure 8.18. The culvert is 35 m long and has a square-edged entrance and slope of 0.003. Determine the diameter of the pipe.

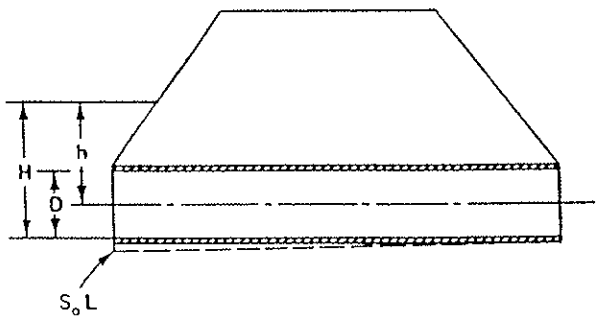

Figure 8.18

Solution

(a) Allowing full pipe flow, the energy balance of the culvert flow may be expressed as (see Figure 8.18),

$$h_L = H - D + S_o L = 3.2 - D + 0.003 \cdot 35$$
$$= 3.305 - D$$

where D is the diameter of the pipe. Also, from Equation (8.18), we have,

ATTACHMENT D, 2/2

The U.S. Bureau of Reclamation (1973) uses the following criterion for grain size of filter materials in relation to openings in pipes:

$$\frac{D_{85} \text{ of the filter nearest the pipe}}{\text{maximum opening of pipe drain}} = 2 \text{ or more} \qquad (5.6)$$

Equations 5.4, 5.5, and 5.6 represent a reasonable range over which satisfactory performance can be expected.

An important development in the manufacture of drainage pipes is the slotted PVC pipe (Cedergren, 1987) which has slots machined to specified widths from a minimum of 0.010 in. (0.25 mm) up to 0.10 in. (2.54 mm) or larger. Figure 5.3 shows a PVC pipe 6 in. (15.2 cm) in diameter with sawed slots of uniform size. Close control over the width of the slots ensures free flow of water into the pipe without danger of clogging with soil when the slotwidths have been correctly established with Eq. 5.4.

5.3 EXAMPLES OF FILTER DESIGNS TO PREVENT PIPING

Historical

Before the development of rational and experimental filter design criteria drain design was considered more of an art than a science. Designers depended on judgment, instinct, or precedent. In many instances coarse stone or gravel was placed in direct contact with fine-grained soils with the result that drains often became clogged or soil piped through them, thus causing structural failures.

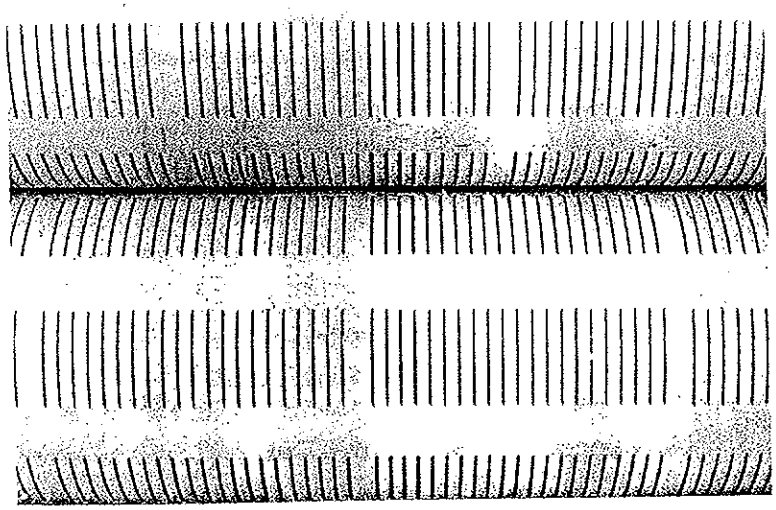

FIG. 5.3 Slotted PVC drain pipe 6-in. in diameter. Machined slots of uniform width provide good filter protection.

Standard Specification
for

Sizes of Aggregate for Road and Bridge Construction

AASHTO DESIGNATION: M 43-88
(ASTM DESIGNATION: D 448-86)

1. SCOPE

1.1 This specification defines aggregate size designations and ranges in mechanical analyses for standard sizes of coarse aggregate and screenings for use in the construction and maintenance of various types of highways and bridges.

1.2 The values stated in SI units are to be regarded as the standard.

2. REFERENCED DOCUMENTS

2.1 *AASHTO Standards:*

T 27	Sieve Analysis of Fine and Coarse Aggregates
T 2	Sampling Aggregates
M 92	Wire-Cloth Sieves for Testing Purposes

3. SIGNIFICANCE AND USE

3.1 Contract documents may specify certain of these aggregate sizes for specific uses or may suggest one or more of these sizes as appropriate for the preparation of various end-product mixtures. In some cases, closer limits on variability of the aggregate grading may be required.

4. MANUFACTURE

4.1 The standard sizes of aggregate described in this classification may be manufactured by means of any suitable process used to separate raw material into the desired size ranges. Standard sizes may also be produced by blending two or more different components.

5. STANDARD SIZES

5.1 Standard sizes of coarse aggregate shall comply with the sizes given in Table 1. All sizes shall be determined by means of laboratory sieves having square openings and conforming to M 92.

6. BASIS OF CLASSIFICATION

6.1 Classification is based npon the size number and size ranges shown in Table 1 with the aggregate sampled in accordance with T 2 and tested for grading by T 27.

TABLE 1 Standard Sizes of Processed Aggregate

Permeability

Falling head permeability tests were conducted on remolded samples in general accordance with modified ASTM procedure D2434. The soil was compacted in a mold 4.6 inches long and 4.0 inches in diameter to 85 or 90 percent of maximum dry density and at optimum moisture content. A falling head was applied to the sample and the flow of water through the sample was monitored. The permeability was calculated after the flow rate had stabilized. The result of the falling head permeability test is presented in the following table:

Exploration Location	Sample Depth (Feet)	Soil Description	k (cm/s)
B-5	20-25	Silty sand with gravel	5.3×10^{-4}
B-12	10-15	Silty sand with gravel	4.0×10^{-4}
B-102	20-25	Silty sand with gravel	1.0×10^{-4}
B-105	20-25	Well graded sand with silt and gravel	1.2×10^{-3}

Flexible wall permeameter tests were performed on selected samples by AP Engineering and Testing, Inc according to ASTM D5084. With the exception of one sample (B-105), all tested samples were undisturbed ring samples. The samples were placed in a triaxial machine with a constant confining pressure at the approximate in-place effective stress pressures. Results were generally consistent with the fal-

PIPE STRENGTH CALCULATIONS
BRC CAMU
HENDERSON, NEVADA

OBJECTIVE

A 4-in diameter HDPE leachate collection pipe and 18-in diameter side slope riser will be constructed at the BRC Corrective Action Management Unit (CAMU) in Henderson, Nevada. The objective of this calculation package is to evaluate the pipe strength performance and size the pipe wall thickness (i.e., determine the SDR).

SITE CONDITIONS

Crushed gravel will be backfilled around the 4-in and 18-in pipes. The maximum height of waste soil placed above the pipes will be 93 ft. Short term construction and long-term conditions will be evaluated.

LOADING CONDITIONS

The following two loading conditions were evaluated:

1. Short-Term Loading: Haul Truck (H-20)

   The ground pressure applied by the haul truck was estimated to be 100 psi as shown in Attachment A, p. 2. Based on the maximum axle load of 18 kips, the total load on the tire is 9 kips. Therefore, the footprint of the tire is approximately 0.63 ft^2 (see Attachment A). During construction, it was assumed that a minimum of 1 ft (0.3 m) of cover soil will separate haul trucks from the leachate collection pipes. Using Boussinesq's solution for a uniformly loaded square area, the assumed vertical pressure on the top of the pipe is 25 psi (see Attachment A).

2. Long-Term: Waste Soil Overburden Pressure

   Post construction, the maximum overburden soil will exist over the pipe at the southwest sump at a total depth of 93 ft (28.3 m). The unit weight is assumed to be 136 pcf. Additional loads from equipment is assumed to be negligible. The vertical pressure is calculated by:

Written by: Rebecca Flynn Date: 06/08/21 (YY/MM/DD) Reviewed by: GTC Date: 06/11/3 (YY/MM/DD)

Client: BRC Project: BRC CAMU Project/Proposal No.: SC0313 Task No.: 01-04

P = 93 ft (136 pcf) /144 in^2/ft^2 = 87.8 psi.

Therefore, the vertical pressure on the top of pipe in the long-term condition is 87.8 psi.

Since the long-term load (#2) is greater than short-term load (#1), only the long-term load (#2) was considered herein.

METHOD OF ANALYSES

Ring deflection, wall buckling, and wall crushing of the pipe were evaluated for the loading conditions. The Spangler's Modified Iowa Formula was used to calculate ring deflection. Recent literature indicates that the Modified Iowa Formula results in conservative values for pipe deformation (Brachman 1998). The actual deflection is likely lower due to the arching effects of soil via pipe deflection that are neglected in the Modified Iowa Formula. The manufacturer's design manual for Driscopipe (Philips 66, 1991) and Koerner's *Designing with Geosynthetics* (Koerner 1998) was used to evaluate wall buckling and wall crushing. The design criteria were based on the manufacturer's design manual for Driscopipe (Philips 66, 1991).

The method of analysis shown below solves directly for the SDR (Equation 2) of the pipe. Since the SDR is a dimensionless parameter, the diameter of the pipe does not need to be known.

ANALYSIS

Evaluating Variables

E' = 3,000 psi for crushed rock (Philips 66 1998)

P = Long-term loading. Soil Load = 93 ft of soil at 136 pcf = 12,648 psf = 87.8 psi
(Assume haul truck loading is negligible)

E = 30,000 psi
Attachment D (Philips 66, 1991) shows that the modulus of elasticity (E) is approximately 30,000 psi for a 100 year design life.

Design by Wall Buckling

Wall buckling is generally the critical failure case for buried pipes. Naturally, this is a starting point for initial values for the SDR.

Written by: Rebecca Flynn Date: 06/08/21 (YY/MM/DD) Reviewed by: BTC Date: 06/11/3 (YY/MM/DD)

Client: BRC Project: BRC CAMU Project/Proposal No.: SC0313 Task No.: 01-04

The SDR is defined as:

SDR = D/t (Equation 1)

where D= outside diameter of pipe
t = minimum pipe wall thickness

Assume a factor of safety of 2.0 for buckling (Philips 66 1998). Therefore:

$FS = 2.0 = P_{cb}/P_T$ (Equation 2) (Attachment D)

where P_{cb} = critical buckling pressure at top of the pipe, and
P_T = total soil pressure at the top of the pipe = 87.8 psi

Solving Equation 2 for the critical buckling pressure, P_{cb}, yields:

P_{cb} = 175.6 psi

The critical buckling pressure, P_{cb} is defined (Philips 66 1998) as:

$$P_{cb} = 0.8\sqrt{(E')(P_c)}$$ (Equation 3) (Attachment D)

where: P_c = critical collapse pressure
E' = soil modulus = 3,000 psi

The critical collapse pressure can be determined by the following equation:

$$P_c = \frac{2E(t/D)^3(D_{min}/D_{max})^3}{1-\mu^2}$$ (Equation 4)(Attachment D)

where: E = pipe modulus = 30,000 psi
D = outside diameter
t = thickness
(D_{min}/D_{max}) = 0.95
μ = Poisson's Ratio = 0.45 for HDPE pipe

Written by: Rebecca Flynn Date: 06 / 08 / 21 (YY MM DD) Reviewed by: EC Date: 06 / 11 / 3 (YY MM DD)

Client: BRC Project: BRC CAMU Project/Proposal No.: SC0313 Task No.: 01-04

Equation 4 can be reduced to the following equation:

$$P_c = \frac{2.15(E)}{SDR^3} \qquad \text{(Equation 5) (Attachment D)}$$

Inserting Equation 5 and rearranging, Equation 3 becomes:

$$SDR^3 = 0.64(E')\frac{2.15E}{P_{cb}^{\ 2}} \qquad \text{(Equation 6)}$$

By inserting the appropriate value determined above, the following result is obtained:

SDR = 15.9, use 13.5 (13.5 < 15.9, OK)

Check Wall Crushing

Wall crushing occurs when the compressive strength of the pipe is exceeded by the overburden soil pressure. For example, the compressive yield strength for HDPE pipe manufactured by Driscopipe is 1,500 psi (Philips 66, 1998). Assuming a factor of safety of 2.0, the required compressive strength of the pipe becomes:

FS = 2.0 = 1500 psi / S_A, therefore S_A = 750 psi (Equation 7)(Attachment D)

The hoop stress in the pipe is expressed as:

$S_A = (SDR-1)P_T/2$ (Equation 8) (Attachment D)

where: P_T = total external pressure = 87.8 psi

Rearranging, Equation 9 becomes:

$SDR = [2(S_A)/P_T] + 1$ (Equation 9)

Therefore, the design SDR is shown below:

SDR = 18.1 > 13.5 O.K.

Check Ring Deflection

Ring deflection is the change in the vertical diameter of the pipe as the pipe/aggregate system deforms under the external vertical pressure. Ring deflection can be evaluated using Spangler's Modified Iowa formula and can be expressed as follows (Koerner 1998):

$$\Delta y = \frac{D_L K_b W_c}{(EI / r^3) + 0.061E'}$$ (Equation 10) (Attachment B)

Rearranging Equation 11 to express SDR and the percent pipe deflection directly:

$$\frac{\Delta y}{D} = \frac{D_L K_b P}{(2E) / (3(SDR - 1)^3) + 0.061E'}$$ (Equation 11)

where:

Δy	= pipe deflection or change in diameter, in.
D	= pipe diameter, in.
W_c	= prism soil load, lb/in of pipe
P	= prism soil load, psi = 87.8 psi
K	= bedding constant, typically 0.083 (Attachment E)
SDR	= standard dimension ratio (SDR) = 13.5
E	= modulus of elasticity of pipe, 30,000 psi
E'	= modulus of soil reaction, 3,000 psi
D_L	= deflection lag factor, 1.3 (range 1.0 to I.5)

Solving for Equation 12 for the critical load yields:

$$\frac{\Delta y}{D} = \frac{(1.3)(0.083)(87.8)}{2(30{,}000)/3(13.5-1)^3 + 0.061(3000)} = 4.9\%$$

The maximum allowable ring deflection for SDR 13.5 pipe is approximately 5.1% at 1.5% strain (Attachment D). Therefore, the estimated ring deflection is acceptable.

Client: BRC Project: BRC CAMU Project/Proposal No.: SC0313 Task No.: 01-04

SUMMARY AND CONCLUSIONS

Based upon these calculations for pipe ring deflection, wall buckling, and wall crushing, an HDPE pipe with an SDR of 13.5 satisfies the design criteria.

The pipe compressive strength and the design methods and criteria were based on the Driscopipe manufacturer's design manual (Philips 66, 1998). These parameters might be slightly different for the specific pipe used at BRC CAMU. However, the factors of safety against wall buckling and wall crushing calculated herein will account of uncertainty or differences in the pipe compressive strength or in the design methods and criteria.

CONSIDERATIONS FOR SPECIFICATIONS

In accordance with the above analyses, the following items should be included in the specifications for construction at the BRC CAMU:

- A pipe with a maximum SDR of 13.5.
- A minimum of 1 ft (0.3 m) of cover soil shall be placed over the pipes before a haul truck is allowed to drive over them.
- Compacted crushed rock shall be placed in the pipe trench.

→ From Das (1994)

Table 7.1, Variation of I_1

Due to shallow depths and large distance to point loads, influence of point load wheels are negligable.

→ From Das (1994)

Evaluate stress increases due to wheel directly above pipe:

- contact pressure of 100 psi
- radius of footprint = $R = \sqrt{\frac{P}{p\pi}} = \left[\frac{9K}{(100)(144)\pi}\right]^{1/2}$

$R = 0.45$ ft

- assume flexible circular footprint (Das, 1994)

$$\Delta p = q\left\{1 - \frac{1}{[(R/z)^2+1]^{3/2}}\right\}$$

$z = 1$ ft, $R = 0.45$ ft, $q = 100$ psi

$$\Delta p = 100\left\{1 - \frac{1}{[(0.45/1)^2+1]^{3/2}}\right\}$$

$\Delta p = 24$ psi

add soil 1 ft = 130 psf / 144 = 0.94 psi

$\Delta p = 25$ psi : total external pressure

vertical stress, dp, at point A caused by the load on the elemental area (which may be assumed to be a concentrated load) can be obtained from Eq. (7.11):

$$dp = \frac{3(qr\ dr\ d\alpha)}{2\pi} \frac{z^3}{(r^2 + z^2)^{5/2}} \tag{7.24}$$

The increase in the stress at A caused by the entire loaded area can be found by integrating Eq. (7.24), or

$$\Delta p = \int dp = \int_{\alpha=0}^{\alpha=2\pi} \int_{r=0}^{r=R} \frac{3q}{2\pi} \frac{z^3 r}{(r^2 + z^2)^{5/2}}\, dr\, d\alpha$$

So

$$\Delta p = q\left\{1 - \frac{1}{[(R/z)^2 + 1]^{3/2}}\right\} \tag{7.25}$$

The variation of $\Delta p/q$ with z/R as obtained from Eq. (7.25) is given in Table 7.5. A plot of this is also shown in Figure 7.17. The value of Δp decreases rapidly with depth, and, at $z = 5R$, it is about 6% of q, which is the intensity of pressure at the ground surface.

7.8 VERTICAL STRESS BELOW THE CENTER OF A UNIFORMLY LOADED CIRCULAR AREA

Using Boussinesq's solution for vertical stress Δp caused by a point load [Eq. (7.11)], one can also develop an expression for the vertical stress below the center of a uniformly loaded flexible circular area.

From Figure 7.16, let the intensity of pressure on the circular area of radius R be equal to q. The total load on the elemental area (shaded in the figure) $= qr\,dr\,d\alpha$. The

Boeing 727	75	1000	7,800
Boeing 747	75	1000	10,500
Douglas DC 9	75	1000	8,000
Convair Cv 880	75	1000	10,500
BAC 1-11	75	1000	7,500

[a] Data from charts in FAA publication (ref. 4).

[b] The lengths shown in the table are relative and are for illustrative purposes only since the required lengths are dependent upon many factors, including effective grade of the runway, setting of the wing flaps, and takeoff weight. Each runway must be analyzed for its own particular conditions and the critical plane using the runway.

In the majority of the problems, circular tire imprints are assumed. Hence the radius of contact is as follows:

$$a = \sqrt{\frac{P}{p\pi}} \qquad A = \frac{P}{p} \tag{1.1}$$

where a = radius of contact
P = total load on the tire
p = tire pressure (assumed to be equal to contact pressure)

For some cases tire imprints as illustrated on Figure 1.8 are used. The relationship between pressure and the geometry of the imprint is as shown on the figure.

DESIGN FACTORS

Pavement design consists of two broad categories: (1) design of the paving mixtures, and (2) structural design of the pavement components. These two design steps must go hand in hand.

The structural design of pavements is basically different from the structural design of bridges and buildings in that the pavement structure lies exposed upon the ground surface and, hence, is greatly influenced by environmental factors. Likewise, a highway, for example, will cross many different soil deposits and it becomes necessary for the design engineer to select in a rational manner a design value representative of the area under question. The strength of soil is affected by many factors, including density, moisture content, soil texture, soil structure, rate of load application, and degree of confinement. In addition, soils

7.2.2 Deflection Issues

An engineering approach to the quantification of deflection of buried pipelines has been developed by a sequential group of research faculty and students at Iowa State University. Beginning with Marston in the 1920s evaluating rigid conduits (the term used for shallow buried pipes), followed by Spangler in 1950–1970 evaluating flexible conduits, and into the present by Watkins, the group and their colleagues have "written the book" for this type of research [12]. Key issues in the development are the use of arching theory for gravitational force dissipation, the importance of subgrade stability, backfill type, and compaction conditions, and finally the flexibility of the pipe structure itself. Moser [13] presents the following equation, summarizing the Iowa State group's effort for the deflection behavior of flexible (in our case plastic) pipe.

$$\Delta X = \frac{D_L K_b W_c}{(EI/r^3) + (0.061E')} \cong y \tag{7.17}$$

where

ΔX = horizontal increase in diameter (m),
y = vertical deflection (m),
D_L = deflection lag factor, which varies from 1.0 to 1.5 (dimensionless),
K_b = bedding constant, which varies from 0.83 to 0.110 (dimensionless),
W_c = Marston's prism load per unit length of pipe (kN/m) (note that arching is not taken into account in this formula),
E = modulus of elasticity of the pipe material (kPa),
I = moment of inertia of the pipe wall per unit length (m^3),
EI = bedding stiffness of the pipe ring per unit length (kN-m),
r = mean radius of the pipe (m), and
E' = modulus of soil reaction (kPa).

The last term (E') has been the subject of intense discussion and research. Howard [14] of the U.S. Bureau of Reclamation has recommended the values given in Table 7.9, which have relatively wide acceptance.

Eq. (7.17) can also be cast in terms of the laboratory plate loading test with the following result. The equation assumes a bedding constant $K_b = 0.2$ and uses the ring stiffness constant (RSC).

$$\frac{y}{D} = \frac{P(0.1L)}{[14.9(\text{RSC})/D + 0.061E']} \tag{7.18}$$

where

y = vertical deflection (m),
D = inside pipe diameter (m),
P = load on pipe (kPa),
L = deflection lag factor (usually 1.0 to 1.5),
RSC = ring stiffness constant (kN/m), and
E' = modulus of soil reaction (kPa).

Where: S_A = Actual compressive stress, psi
SDR = Standard Dimension Ratio
P_T = External Pressure, psi

Safety Factor = 1500 psi ÷ S_A where 1500 psi is the Compressive Yield Strength of Driscopipe.

Design by Wall Buckling: Local wall buckling is a longitudinal wrinkling of the pipe wall. Tests of *non-pressurized* Driscopipe show that buckling and collapse do not occur when the soil envelope is in full contact with the pipe and is compacted to a dense state. However, it can be forced to occur over the long term in *non-pressurized* pipe if the total external soil pressure, P_t, is allowed to exceed the pipe-soil system's critical buckling pressure, P_{cb}. If $P_t > P_{cb}$, gradual collapse may occur over the long term. A calculated, conservative value for the critical buckling pressure may be obtained by the following approximate formula. All pipe diameters with the same SDR in the same burial situation have the same critical collapse and critical buckling endurance

$$P_{cb} = 0.8\sqrt{E' \times P_c}$$

Where:

P_t = Total vertical soil pressure at the top of the pipe, psi

P_{cb} = Critical buckling soil pressure at the top of the pipe, psi

E' = Soil modulus in psi calculated as the ratio of the vertical soil pressure to vertical soil strain at a specified density

P_C = Hydrostatic, critical-collapse differential pressure, psi

$$P_C = \frac{2E\,(t/D)^3\,(D_{MIN}/D_{MAX})^3}{(1-\mu^2)}$$

$$P_c = \frac{2.32\,E}{(SDR)^3}$$

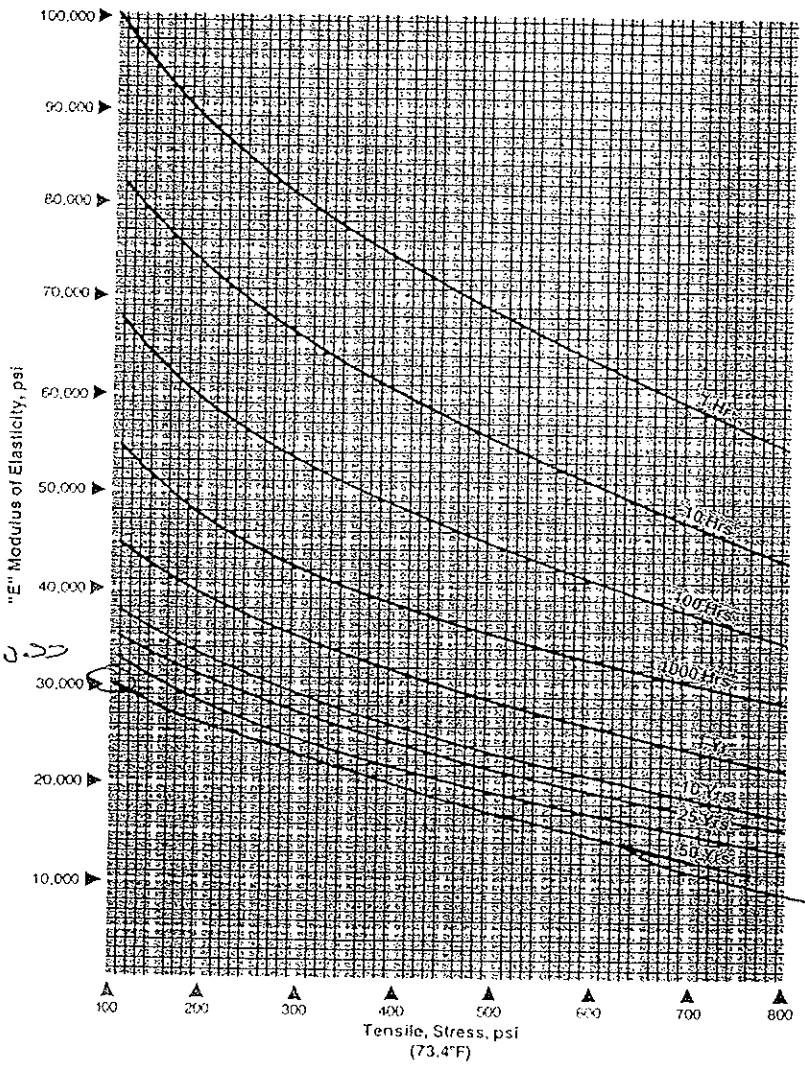
Where: $(D_{MIN}/D_{MAX}) = .95$
μ = Poission's Ratio
μ = .45 for Driscopipe
E = stress and time dependent tensile modulus of elasticity, psi

In a direct burial pressurized pipeline, the internal pressure is usually great enough to exceed the external critical-buckling soil pressure. When a pressurized line is to be shut down for a period, wall buckling should be examined.

Design by Wall Buckling Guidelines
Although wall buckling is seldom the limiting factor in the design of a Driscopipe system, a check of non-pressurized pipelines can be made according to the following steps to insure $P_t < P_{cb}$:

1. Calculate or estimate the total soil pressure, P_t, at the top of the pipe
2. Calculate the stress "S_A" in the pipe wall according to the formula:
$$S_A = \frac{(SDR - 1)\,P_t}{2}$$
3. Based upon the stress "S_A" and the estimated time duration of non-pressurization, use Chart 25 to find the value of the pipe's modulus of elasticity, E, in psi

Chart 25
Time Dependent Modulus of Elasticity for Polyethylene Pipe vs. Stress Intensity (73.4°F)



NOTE: The short term modulus of elasticity of Driscopipe per ASTM D 638 is approximately 100,000 psi. Due to the cold flow (creep) characteristic of the pipe material, this modulus is dependent upon the stress intensity and the time duration of the applied stress.

III	Coarse grained soils with fines	Not Recommended	Not Recommended	1,000	2,000
IV	Fine Grained Soils	Not Recommended	Not Recommended	Not Recommended	Not Recommended
V	Organic Soils (Peat, Muck, Clay, etc.)	Not Recommended	Not Recommended	Not Recommended	Not Recommended

Note: This summary of ASTM D 2321 is provided for the design engineer's convenience. This specification should be reviewed in detail before specifying burial conditions.

MINIMUM COVER There are no firm rules regarding minimum burial depth. The variables change for each installation, and the designer should check each design for wall crushing, wall buckling, and ring deflection. However, the following guidelines may be helpful.

- Consider a burial depth below the local frost line.
- Where there will be no overland traffic, the designer may wish to consider a cover of 18" or one diameter, whichever is greater.
- Where truck traffic may be expected, the designer may wish to consider a burial depth of 36" or one diameter, whichever is greater.
- Where heavy off-the-road truck or locomotive traffic is expected, the designer may wish to consider a minimum cover of 5 feet or more.

CALCULATION OF TOTAL SOIL PRESSURE BY COMPONENTS Proper design of the polyethylene "pipe-soil" system balances the response of the pipe and surrounding soil against the total external soil pressure. Burial design by wall crushing, wall buckling, and ring deflection require the calculation of the total soil pressure, P_T, at the top of the pipe. There are many sources of soil pressure above the pipe. It is helpful to examine the total soil pressure as the sum of its components.

Attachment D
1/6

FIGURE 6: COOPER E-80 LIVE LOADING

Source: American Iron and Steel Institute, Washington, DC

APPARENT EXTERNAL PRESSURE DUE TO INTERNAL VACUUM, P_I Vacuum generates a compressive hoop stress in the wall of a pipe and acts to collapse the pipeline. Under vacuum conditions, the value of P_I is positive. P_I is added to the other two external pressure components, P_S and P_L, to obtain the total external pressure, P_T, acting on the pipe. An internal vacuum generates pressure equal to the absolute value of the vacuum. The maximum apparent external pressure due to a vacuum inside the pipe is 14.7 psi (2,117 psf).

BURIAL DESIGN GUIDELINES The design engineer must select the proper pipe DR and specify the backfill conditions to obtain the desired performance of the "pipe-soil" system.

DESIGN BY WALL CRUSHING Wall crushing occurs when external vertical pressure causes the compressive stress in the pipe wall to exceed the long-term compressive strength of the pipe material. To design for wall crushing, the following check should be made:

$$S_A = \frac{(SDR-1)}{2} P_T$$

Where: S_A = Actual compressive stress, psi
SDR = Standard Dimension Ratio
P_T = Total external pressure on the top of the pipe, psi

Safety Factor = 1500 psi /S_A (where 1500 psi is the compressive yield strength of Driscopipe HDPE pipe)

DESIGN BY WALL BUCKLING Local wall buckling is a longitudinal wrinkling of the pipe wall. Buckling can occur over the long term in non-pressurized pipe if the total external soil pressure, P_T, exceeds the pipe-soil system's critical buckling pressure, Pcb . Although wall buckling is seldom the limiting factor in the design of a Driscopipe system, a check of non-pressurized pipelines can be made according to the following steps to insure $P_T < P_{cb}$. All pipe diameters with the same DR in the same burial situation have the same critical collapse and critical buckling endurance.

Attachment D
2/4

1. Calculate or estimate the total soil pressure, P_T, at the top of the pipe.

2. Calculate the stress, S_a, in the pipe wall:

$$S_A = \frac{(SDR-1)}{2} P_T$$

3. Based upon the stress, S_a, and the estimated time duration of non-pressurization, find the value of the pipe's modulus of elasticity, E, in psi (approximate value for E is 35,000 psi).

4. Calculate the pipes hydrostatic, critical-collapse differential pressure, P_c

$$P_C = \frac{2E(t/D)^3 (D_{MIN}/D_{MAX})^3}{(1-\mu^2)} \quad \text{or} \quad P_c = \frac{2.32(E)}{SDR^3}$$

$$P_c = \frac{2.15(E)}{SDR^3}$$

Where: $(D_{MIN}/D_{MAX}) = 0.95$
μ = Poission's Ratio = 0.45 for polyethylene pipe
E = stress and time dependent tensile modulus of elasticity, psi
E = 35,000 psi (approximate)
D = Outside Diameter, in.
t = thickness, in.

5 Calculate the soil modulus, E', by plotting the total external soil pressure, P_T, against a specified soil density to derive the soil strain as shown in the example problem below Figure 7.

6. Calculate the critical buckling pressure at the top of the pipe by the formula:

$$P_{cb} = 0.8\sqrt{(E')(P_c)}$$

Where: P_{cb} = Critical buckling soil pressure at the top of the pipe, psi
E' = Soil Modulus, psi
P_c = Hydrostatic critical-collapse differential pressure, psi

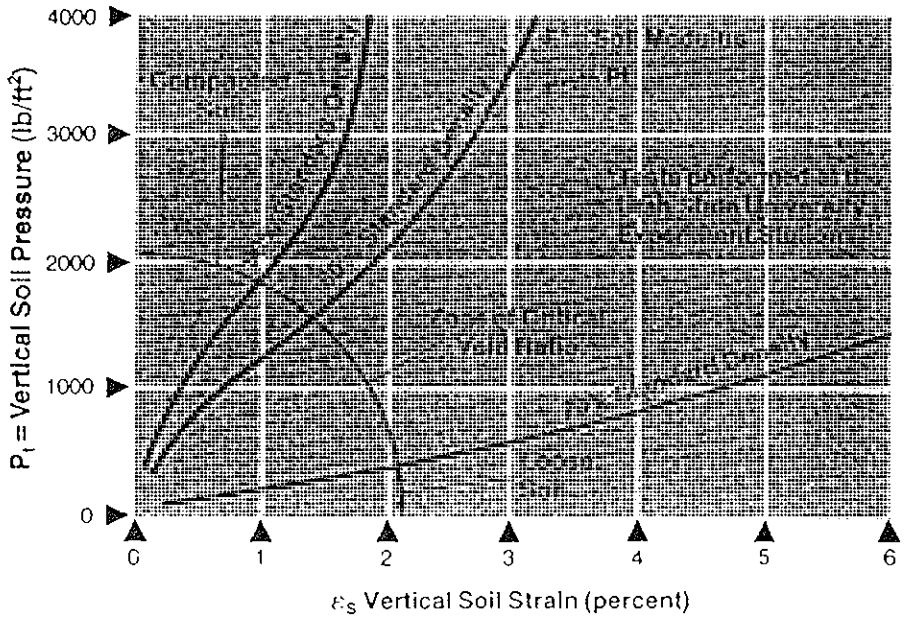
7. Calculate the Safety Factor: $SF = P_{cb} / P_T$.

8. The above procedures can be reversed to calculate the minimum pipe DR required for a given soil pressure and an estimated soil density.

In a direct buried pressurized pipeline, the internal pressure is usually great enough to exceed the external critical-buckling soil pressure. When a pressurized line is to be shut down for a period, wall buckling should be examined.

Attachment D
3/4

FIGURE 7: PLOT OF VERTICAL STRESS-STRAIN DATA FOR TYPCIAL TRENCH BACKFILL (EXCEPT CLAY) FROM ACTUAL TESTS



Example:
Find: E' @ 2000 psf and 80% density
Formula: $E' = PT/\varepsilon_s$
Calculations: E' = 2000 psf / (0.018 * 144) = 771 psi

Note: The curves shown on this chart are sample curves for a granular soil. If other types of soil are used for backfill such as clay or clay loam, curves should be developed from laboratory test data for the material used. Soil pressures greater than 4000 psf may be extrapolated with the slope of the curve or curves can be generated by testing at higher soil pressures. Probable error of curves is about half the distance between adjacent lines.

Design by Ring Deflection Ring deflection, by definition, is the ratio of the vertical change in diameter to the pipe's original diameter. It is often expressed as a percentage.

Driscopipe HDPE pipe is designed to be "flexible". This assumes the pipe will deflect the same as the vertical compression of the soil around it. Design by ring deflection matches the ability of the pipe to accommodate, without structural distress, the vertical compression of the surrounding soil. Design by ring deflection calculates the vertical soil strain and compares it to the allowable ring deflection of the pipe.

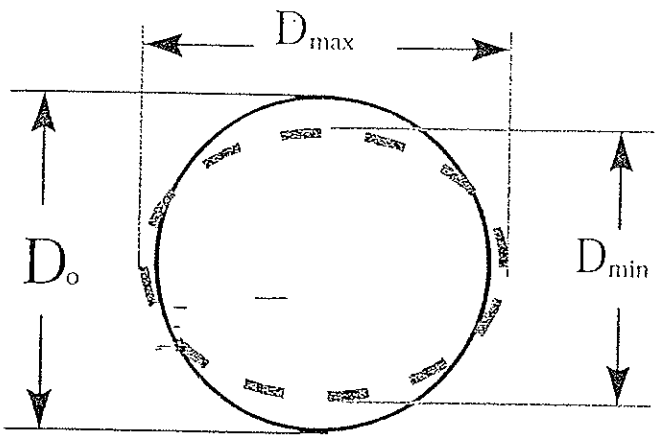
13.5	3.4%
11	2.7%

The allowable ring deflection of polyethylene pipe is limited to create no more than 1 to 1.5% tangential strain in the outer surface of the pipe wall. As the wall of a pipe becomes thicker (a "lower" DR value), the distance from the neutral axis to the outer surface increases. As a result, less deflection is required to create the allowable tangential strain. Deflection of the pipe-soil system is controlled by proper specification of the backfill compaction.

FIGURE 8: CALCULATING RING DEFLECTION



$$\%\,Ring\,Deflection = \left(1 - \frac{D_{min}}{D_o}\right) \times 100\%$$

The percentage ring deflection based upon strain for a given DR pipe can be calculated as follows:

$$\frac{\Delta Y}{D} = (0.25)(\varepsilon)(SDR)$$

Attachment D
5/6

Where: ΔY = Vertical deflection, in.
D = Pipe OD, in.
ε = Tangential strain in the surface of the pipe ring, in./in.
SDR = Standard Dimension Ratio

Driscopipe recommends limiting tangential surface strain to 0.01. This value is based upon the following criteria:

- Most of the deflection of a flexible pipe occurs within a few days after final backfill is completed. Development of a soil arch over the pipe relieves the pipe of much of the vertical soil load by the arching action of the soil envelope and by the development of soil restraint at the sides of the pipe.
- An allowable strain value of 0.01 will allow for reasonable additional deflection due to disturbance of the backfill by earthquake, fluctuations of the water table, etc.
- An allowable design strain value of 0.01 allows for the normal deviation of temperature encountered during installation.

In summary, a soil density can be specified for the bedding and initial backfill so that total soil pressure at the top of the pipe, P_T, will not cause a given DR pipe to exceed its maximum allowable ring deflection.

SLOPE STABILITY EVALUATION
VENEER STABILITY OF GEOSYNTHETIC-SOIL LINED SIDESLOPES

OBJECTIVE

To evaluate the tension developed within the geosynthetic-soil layered sideslope of the BRC Corrective Action Management Unit (CAMU) located in Henderson, Nevada.

METHOD OF ANALYSIS

The stability analysis of the geosynthetic-soil layered systems was carried out using the approach outlined by McKelvey (1994). McKelvey (1994) calculates the tension of a geosynthetic component along a geosynthetic-soil layered sideslope and compares it to the allowable geosynthetic strength to evaluate the overall factor of safety against tension. McKelvey (1994) allows for the consideration of tapered slopes and equipment loads. The calculations herein were performed by a spreadsheet developed by McKelvey that has been verified numerous times, so verification will not be presented herein.

SIDESLOPE LINER SYSTEM

The sideslope liner system (Attachment A) consists of, from top to bottom:

- 2 ft (min) 2.5H:1V tapered operations layer material (10 ft max height),
- a drainage geocomposite;
- ~~a non-woven cushion geotextile;~~ GLS
- a 60-mil (1.5-mm) thick textured high density polyethylene (HDPE) geomembrane;
- a geosynthetic clay liner (GCL); and
- subgrade.

The sideslope inclination is 2.1H:1.0V. The maximum height of the side slope is 30 vertical feet.

MATERIAL SHEAR STRENGTHS

Operations Layer Material and Drainage Aggregate:

The soil materials to be used overlying the side slope liner system will be native materials such as silty sands (SM) for the operations layer. The operations layer material is charaeterized by an internal angle of friction of 31 degrees (Attachment B). Converse reported a maximum dry density of 132 pcf and a optimum water content of 8.7 percent for materials at the site. Therefore, assuming 95% relative compaction, the dry density in the field is approximately 125 pcf. Adding the weight of water, the unit weight is approximately 136 pcf (Attachment B).

For this analysis, a shear strength of ~~31~~ 30 degrees and a unit weight of ~~132~~ 130 pcf will be used for the analyses performed herein.

Geosynthetic interface:

The following values for the interface friction between geosynthetic and soil components of the liner system will be used in this calculation:

Operations Layer to Geocomposite (NWGT side)	25 (Attachment D)
~~Geocomposite (GN side) to Cushion Geotextile~~	~~30 (Attachment D)~~ 18
Cushion Geotextile to Textured HDPE	28 (Attachment E)
Textured HDPE to Dry GCL	18 (Attachment F)
Dry GCL to Subgrade	28 (Attachment F)

The critical loading for the side slope liner system occurs during construction when dozers are placing the ~~drainage aggregate and~~ operations layer materials up the slope. Global stability analyses have been performed to determine the long-term stability of the liner system. Therefore, the GCL component of the liner system was selected to be dry, since hydration will likely occur only after the construction phase is complete, and the normal stress used in obtaining the interface friction will be low (i.e. less than 5 psi).

The minimum shear strength along the geosynthetic interfaces of the sideslope liner system was assumed to occur at the interface of the textured HDPE geomembrane/GCL. A shear strength value of 18 degrees will be used in the tension analysis for the textured HDPE geomembrane/GCL interface as suggested in Attachment F.

DESIGN CRITERION

The geosynthetic-soil lined sideslopes are considered interim slopes because they will eventually be buttressed by placement of waste. Due to the limited duration during which the geosynthetic-soil lined slope will exist before it is buttressed by waste, seismic stability analyses were not conducted.

RESULTS AND CONCLUSIONS

The computer output for the analyses are presented in pages 4-5. The results suggest the following:

Live Load Case (assuming placement of operations layer with a bulldozer no larger than Caterpillar D6H-LGP dozer in terms of operating weight and ground pressure), the side slope liner system will not be placed into tension.

Direct Shear Strength

A progressive direct shear test was performed on selected undisturbed samples using a constant strain rate direct shear machine in general accordance with ASTM D3080. The test specimen was trimmed and placed in the shear machine, a specified normal load was applied, and the specimen was sheared until maximum shear strength was developed. After the soil specimen had developed maximum shear resistance under the first normal load, the normal load was removed and the specimen was pushed back to its original undeformed configuration. Another normal load was then applied, and the specimen was sheared a second time. This process was repeated for three different normal loads. Results of the direct shear test are presented on Figures A-62 through A-69 and in the following table:

Exploration Location	Depth (Feet)	Soil Description	Angle of Internal Friction (deg)	Coulomb Cohesion (ksf)
B-4	14-14.5	Silty sand with gravel	31	0.7
B-5	14-15	Silty sand with gravel	43	0.3

Chemical Analysis

Chemical tests were performed on a representative soil samples to investigate the potential for soil corrosivity and chemical heave. Atlas Chemical Testing Laboratories, Inc. in Las Vegas performed the chemical analysis for water-soluble sulfates and sodium in general accordance with ASTM D516. The results of the chemical tests are presented on Drawing No. A-70.

Laboratory Maximum Density

Laboratory maximum density tests were performed on selected samples of the granular soils. The purpose of the test was to define the compaction characteristics of these soils, and to aid in estimating soil shrinkage. The laboratory maximum density test was performed in general accordance with the ASTM D1557 test method. This test procedure uses 25 blow of a 10-pound hammer falling a height of 18 inches on each of five layers of soil in a 1/30 or 1/13 cubic foot cylinder. The test results are presented on Drawing Nos. A-57 through A-61 and in the following table:

Exploration Location	Depth (Feet)	Soil Description	Maximum Dry Unit Weight (pcf)	Optimum Moisture Content (percent) of dry weight)
B-1	20-25	Silty sand with gravel	129.4	8.2
B-5	20-25	Silty sand with gravel	132.1	8.2
B-12	10-15	Silty sand with gravel	129.7	7.9
B-101	5-10	Silty sand with gravel	130.6	8.7
B-105	20-25	Well graded sand with silt and gravel	131.8	7.5

nematic diagrams of test setups for friction and pullout evaluation of ls. (a) Soil-to-fabric friction test and results. (b) Fabric pullout (anchor-

between the fabric and the soil with no further increase in n the test is repeated at different normal stresses, a trend is shear strength parameters can be obtained. Note that these parameters are related to, but not necessarily the same as, the ers. They (the soil parameters) are, however, the conservative fabric parameters. Often an efficiency, as defined below, is of soil shear strength parameters that is mobilized, e.g.,

$$E_c = (c_a/c) \times 100 \qquad (2.7)$$

$$E_\phi = (\tan \delta/\tan \phi) \times 100 \qquad (2.8)$$

n cohesion,
n friction angle,
f soil to fabric,

c = the cohesion of soil,
δ = the friction angle of soil to fabric, and
ϕ = the friction angle of soil.

Results from such a test setup by Martin, et al. [13], are presented in Table 2.6 for four geotextile types against three different cohesionless soils. Soil-to-fabric friction angles are given, as well as the fabric efficiency versus the soil friction angle by itself as per Equation 2.8. Here it is seen that most geotextiles can mobilize a high percentage of the soil's friction and can be used to advantage in situations requiring this feature. A review and compilation of a number of direct shear tests on various fabrics against different granular soils is given by Richards and Scott [14]. Another review by Williams and Houlihan [15] covers a wider range of soils, including some sands, silts, and mixed soils.

2.2.3.11 Pullout (Anchorage) Tests

Geotextiles are often called upon to provide anchorage for many applications within the reinforcement function. Such anchorage usually has the fabric sandwiched between soil on each side of it. The resistance can be modeled in the laboratory using a pullout test, shown schematically in Figure 2.8b. The pullout resistance is obviously dependent on the normal force applied to the soil surrounding it, which mobilizes shear forces on both sides of the fabric.

Test results by Collios et al. [16] show a relationship of pullout test results to shear test results with some notable exceptions. If the soil particles are smaller than the fabric openings, efficiencies are higher; if not, they can be lower. In all cases, however, pullout test resistances are less than shear test resistances. This is due to the fact that the fabric is taut and exhibits large deformations. This in turn causes the soil particles to reorient themselves into a reduced-shear-strength situation at the soil-fabric interfaces, resulting in lower pullout resistance. The stress state mobilized in this test is a very complex one requiring additional research.

TABLE 2.6 SOIL-TO-FABRIC FRICTION ANGLES AND EFFICIENCIES (IN PARENTHESES) IN COHESIONLESS SOIL

SLT North America, Inc.

FrictionFlex™ Application Data

SLT's FrictionFlex process provided the industry's first textured liner. It is the only geomembrane texturing process ever to be granted a U.S. Patent. It, in fact, has been awarded two*. In direct contrast to blown-film geomembranes which are textured or made rough by a process which actually erodes the sides of the sheet, the FrictionFlex process is additive. SLT begins with 24-foot wide SLT HyperFlex™ or UltraFlex™ sheet manufactured to the industry's most exacting standards. Only after the sheet passes all QC, is texturing added to one or both sides as required by the application. When the engineer utilizes SLT geomembranes textured by the FrictionFlex process, increased facility design capacity, service life and total revenue potential can be obtained. Containment slopes, vertical expansions and perimeter slopes in closures share the benefits of greater air-space and superior cover stability.

Most importantly, the advantages of FrictionFlex are available without compromise of any performance property or other issue of secure containment. The patented manufacturing process enables SLT to produce a textured liner exhibiting similar mechanical and chemical properties demanded of SLT's premium grades of smooth geomembrane liners, whether HDPE, VLDPE or LDPE.

An added feature of SLT's process is that an edge, 6-to-8 inches wide, is left smooth to aid in welding and field quality control. This allows standard installation equipment and procedures to ensure expedient construction.

The following reflects independent data confirming superior FrictionFlexed liner performance in contact with soils and synthetics:

- Highest coefficient of friction with soils
- Highest coefficient of friction with synthetics
- Premium grade mechanical and chemical properties

SLT Textured Liner Materials				Typical Smooth HDPE
Material	Coefficient of Friction	Adhesion (per square foot)	Average Friction Angle (degrees)	Comparable Friction Angle
Sandy Glacial Till	0.74	27	36	20
Sandy Clay	0.70	65	35	18
Smooth Clay	0.62	39	32	16
Ottawa Sand	0.59	21	3[illegible]	19
Non-woven Polyester Geotextile	0.54	116	28	11
Non-woven Poly-propylene Geotextile	0.65	133	33	12

NOTE: The above data is approximate. SLT recommends that specific data be developed for all application designs. Sheat box testing of the specific geosynthetic and natural components of the composite is necessary to establish an appropriate design basis. SLT will be pleased to provide any necessary material samples for such purposes and invites compararive procedures.

GEOTEXTILE PERFORMANCE REQUIREMENTS
BRC CAMU
HENDERSON, NEVADA

OBJECTIVE

It is proposed that the drainage system for the BRC Corrective Action Management Unit (CAMU) located in Henderson, Nevada include a geonet overlaid by an 8 oz/sy geotextile on the top side of the geonet acting as a filter geotextile. The geotextile must retain the overlying protective soil to minimize impairment to the underlying geocomposite drainage layer material flow properties and have sufficient mechanical properties for durability. This calculation will evaluate the required performance properties of the filter geotextile.

SUMMARY OF ANALYSIS

The calculations suggest:

- that the separation/filtration geotextile overlying the aggregate drainage layer have an AOS less than sieve No. 70 (0.21 mm), a permittivity greater than 0.8 sec^{-1}, a minimum mass per unit area of 6 $oz./yd^2$, and sufficient mechanical strength properties as outlined in federal guidelines; and

- that the separation/filtration geotextile adhered to the geonet layer have an AOS less than sieve No. 70 (0.21 mm), a permittivity greater than 0.6 sec^{-1}, a minimum mass per unit area of 8 $oz./yd^2$, and sufficient mechanical strength properties as outlined in federal guidelines.

SITE CONDITIONS

The liner system consists of, from top to bottom:

- 2 ft. of operations layer material;
- Drainage geocomposite with an 8 oz/sy geotextile bonded to both sides of the geonet;
- a 60-mil (1.5-mm) textured high density polyethylene (HDPE) geomembrane;
- a geosynthetic clay liner (GCL); and
- subgrade.

Client: BRC Project: CAMU Project/Proposal No.: SC0313 Task No.: 01-04

A cross-section of the lining system is presented as Attachment A.

The operations layer material will consist of on-site material, which has been classified as silty sand to well-graded sand (SM, SM-SW according to the Unified Soils Classification System) (Converse Consultants, 1999) (Attachment F).

ANALYSIS

Filtration Requirements: The geotextile will minimize fine particles of the operations layer material from migrating into the geocomposite drainage layer material. Migration of fine particles would have the adverse effect of decreasing the transmissivity of the geocomposite drainage layer.

The filtration requirements for geotextiles can be evaluated using the "Geotextile Filter Design Manual" developed by Luettich et al., (1991) (Attachment B). Page 2 of Attachment B shows a chart in which soil properties are used to evaluate the retention criteria of the geotextile by determining the maximum allowable apparent opening size (AOS or O_{95}).

The soil cover has been classified as silty or clayey sand and well-graded sand. Both of these classifications suggest that less than fifty percent of the material is fine-grained soils (i.e., smaller than the No. 200, or 0.075 mm, sieve size). To be conservative in the calculations herein, the operations layer is assumed to consist of more than 20 percent clay and to be non-dispersive. Therefore, using page 2 of Attachment B,

> **O_{95} < 0.21 mm**, which corresponds to sieve No. 70, meaning that the geotextile apparent opening size (AOS) must be less than a No. 70 sieve size.

Permeability: The following equation can be used to evaluate the minimum allowable geotextile permeability:

$$k_g > i_s k_s$$ (Luettich et al. (1991), Att. B, p. 1)

where: k_g = permeability of geotextile (cm/s)
i_s = hydraulic gradient (dimensionless)
k_s = permeability of the protective soil cover (cm/s)

Written by: Rebecca Flynn Date: 06/09/06 (YY MM DD) Reviewed by: GTC Date: 06/11/03 (YY MM DD)

Client: BRC Project: CAMU Project/Proposal No.: SC0313 Task No.: 01-04

Hydraulic Gradient, i_s: Attachment B, page 3 from Luettich et al. (1991) lists typical hydraulic gradients for various geotextile drainage applications. In this attachment, a hydraulic gradient of 1.5 for landfill LCRS (landfill leachate collection and removal system) applications is recommended.

Soil Permeability, k_s: A permeability of 1.2×10^{-3} cm/s was used based on permeability testing of site specific soils. (Attachment F)

Therefore,

$k_g > \quad i_s k_s = (1.5)(1.2 \times 10^{-3})$
$k_g > \quad 1.8 \times 10^{-3}$ cm/s

Koerner (1994) suggests applying partial factors of safety to the ultimate flow capacity of the geotextile to account for clogging of the geotextile. Using recommendations given in Table 2.13 on p. 160 of Koerner (1994) (Attachment D), the following partial safety values were applied:

soil clogging and blinding:	10 (5 – 10)	creep reduction of voids:	2.0 (1.5 – 2.0)
intrusion into voids:	1.2 (1.0 – 1.2)	chemical clogging:	1.5 (1.2 – 1.5)
biological clogging:	2.0 (2 – 50)		

Therefore,

$k_g > \quad (1.8 \times 10^{-3})(10)(2)(1.2)(1.5)(2)$
$k_g > \quad 0.13$ cm/s

The thickness of 6 oz/yd^2 (205 g/m^2) and 8 oz/yd^2 (273 g/m^2) nonwoven geotextiles are approximately 65 mils (0.165 cm) and 90 mils (0.229 cm), respectively (Amoco technical literature, Attachment E, p. 1). Dividing the permeability by the thickness of the geotextile results in the following permittivity values:

6 oz./SY = 0.78 sec^{-1}
8 oz./SY = 0.57 sec^{-1}

Mechanical Property Requirements: To ensure proper manufacturing and durability of the geotextile, the geotextile should have appropriate strength requirements. Based on guidelines developed by Task Force 25 (see note below) (Attachment C) for mechanical properties of geotextiles used in applications requiring moderate survivability, the geotextile should have the following properties:

Written by: Rebecca Flynn Date: 06/09/06 (YY/MM/DD) Reviewed by: [illegible] Date: 06/11/03 (YY/MM/DD)

Client: BRC Project: CAMU Project/Proposal No.: SC0313 Task No.: 01-04

Property	Criteria
Grab strength	≥ 130 lb.
Puncture strength	≥ 40 lb.
Mullen burst	≥ 210 lb
Trapezoidal tear	≥ 40 lb
Ultraviolet strength retention	≥ 70 %

Note: Task Force 25 consisted of the American Associated of State and Transportation Officials (AASHTO), the American Building Contractors (ABC), and the American Road Builders and Transportation Association (ARBTA).

CONCLUSIONS

In accordance with the above analysis, the geotextile component of the drainage composite or separation/filtration geotextile shall have the following properties:

6 oz/yd^2

Property	Separation/Filtration Criteria
matrix	nonwoven
mass per unit area	6 oz/yd^2 (205 g/m^2)
apparent opening	≤ 0.21 mm (sieve No. 70)
permittivity	≥ 0.8 s^{-1}
grab strength	≥ 130 lb.
puncture strength	≥ 40 lb.
mullen burst	≥ 210 lb.
trapezoidal tear	≥ 40 lb.
ultraviolet strength retention	≥ 70 %

8 oz/yd^2

Property	Separation/Filtration Criteria
matrix	nonwoven
mass per unit area	8 oz/yd^2 (273 g/m^2)

apparent opening	≤ 0.21 mm (sieve No. 70)
permittivity	≥ 0.6 s^{-1}
grab strength	≥ 130 lb.
puncture strength	≥ 40 lb.
mullen burst	≥ 210 lb.
trapezoidal tear	≥ 40 lb.
ultraviolet strength retention	≥ 70 %

The following is a partial list of geotextile products that should meet the material requirements.

COMPOSITE LINER SYSTEM

ATTACHMENT A 1/1

4.2 Define the Hydraulic Gradient for the Application (i_s)

The hydraulic gradient will vary depending on the application of the filter. Anticipated hydraulic gradients for various applications may be estimated using Figure 3.

4.3 Determine the Minimum Allowable Geotextile Permeability (k_g)

After determining the soil hydraulic conductivity and the hydraulic gradient, the following equation can be used to determine the minimum allowable geotextile permeability [Giroud, 1988]:

$$k_g > i_s k_s$$

The hydraulic conductivity (permeability) of the geotextile can be calculated from the permittivity test method ASTM D 4491; this value can often be obtained from the manufacturer's literature as well. The geotextile permeability is defined as the product of the permittivity, ψ, and the geotextile thickness, t_g:

$$k_g > \psi t_g$$

STEP 5. DETERMINE ANTI-CLOGGING REQUIREMENTS

To minimize the risk of clogging, the following criteria should be met:

- Use the largest opening size (O_{90}) that satisfies the retention criteria.
- For nonwoven geotextiles, use the largest porosity available, but not less than 30 percent.
- For woven geotextiles, use the largest percent open area available, but not less than 4 percent.

do not serve this function, the other, sometimes primary, function will not be served properly. This should not give the impression that geotextiles as separators always play a secondary role. Many situations call for separation only, and in such cases the geotextiles do serve a significant and worthwhile function.

2.5.1 Overview of Applications

Perhaps the target application that can best illustrate the use of geotextiles as separators is their placement between an underlying reasonably firm soil subgrade and a stone base course, aggregate, or ballast placed above the geotextile. We say "reasonably firm" because it is assumed that the subgrade deformation is not sufficiently large to mobilize uniformly high tensile stress in the geotextile. (The application of geotextiles in unpaved roads on soft soils wherein membrane-type reinforcement is developed is treated later in Section 2.6.) Thus for such a separation function to occur, the geotextile must be placed on the soil subgrade and then have stone placed, spread, and compacted on top of it. A number of scenar can be developed showing what geotextile properties are required for a given situation.

2.5.2 Burst Resistance

Consider a geotextile on a soil subgrade with stone of average particle diameter (d_a) placed above it. If the stone is uniformly sized, there will be voids within it that will be available for the geotextile to enter into. This entry is caused by the simultaneous action of the traffic loads being transmitted to the stone, through the geotextile, and into the underlying soil. The stressed soil then tries to push the geotextile up into the voids within the stone. The situation is shown schematically in Figure 2.26. Giroud [59] provides a formulation for the required geotextile strength which can be adopted for this application.

$$T_{reqd} = \frac{1}{2} p' d_a [f(\epsilon)] \tag{2.26}$$

where T_{reqd} = the required geotextile strength,
p' = the stress at the geotextile's surface, which is less than, or equal to,

Permeability

Falling head permeability tests were conducted on remolded samples in general accordance with modified ASTM procedure D2434. The soil was compacted in a mold 4.6 inches long and 4.0 inches in diameter to 85 or 90 percent of maximum dry density and at optimum moisture content. A falling head was applied to the sample and the flow of water through the sample was monitored. The permeability was calculated after the flow rate had stabilized. The result of the falling head permeability test is presented in the following table:

Exploration Location	Sample Depth (Feet)	Soil Description	k (cm/s)
B-5	20-25	Silty sand with gravel	5.3×10^{-4}
B-12	10-15	Silty sand with gravel	4.0×10^{-4}
B-102	20-25	Silty sand with gravel	1.0×10^{-4}
B-105	20-25	Well graded sand with silt and gravel	1.2×10^{-3}

Flexible wall permeameter tests were performed on selected samples by AP Engineering and Testing, Inc according to ASTM D5084. With the exception of one sample (B-105), all tested samples were undisturbed ring samples. The samples were placed in a triaxial machine with a constant confining pressure at the approximate in-place effective stress pressures. Results were generally consistent with the fal-

GEOTEXTILE PUNCTURE PROTECTION OF GEOMEMBRANE

OBJECTIVE

A composite liner system is proposed for the Corrective Action Maintenance Unit (CAMU) located in Henderson, Nevada. The objective of this calculation is to evaluate the maximum particle size of soil materials adjacent to the geomembrane that will not puncture the geomembrane. Specifically, the evaluation will consider the drainage aggregate overlying the geocomposite and geomembrane components of the liner system and the subgrade underlying the geomembrane and GCL components of the liner system.

SUMMARY OF ANALYSIS

The analysis suggests that the following maximum particle sizes and geotextile mass per unit areas will be required:

Soil Component of Liner	Maximum Particle Size	Minimum Mass Per Unit Area
Subgrade	0.75 in	9 oz./SY (GCL)
Angular Drainage Aggregate	1.00 in	16 oz./SY

SITE CONDITIONS

The composite liner system will be comprised of the following components, from top to bottom (Attachment A):

- 2 ft of operations layer material;
- a geocomposite drainage layer;
- 60-mil (1.5 mm) HDPE geomembrane, textured on both sides;
- a geosynthetic clay liner (GCL); and
- prepared subgrade.

The maximum height of waste to be placed within the lined area is 93 ft overlying the drainage sump in the South Mesa, based on the proposed waste fill plan. (Attachment B)

- **OVERLYING PRESSURE:**

The overlying pressure can be estimated based on the maximum future fill height of 93 feet. The unit weight of the waste material was selected to be 136 pcf based on modified proctor tests conducted on soil samples from the site that are similar to the waste material to be placed with in the CAMU. The maximum dry density was determined to be 132 pcf at an optimum moisture content of 8.2%. Assuming that the material will be placed at a density less than 95% degree of compaction, the resulting dry density is 125.4 pcf. Adding the weight of the moisture in the soil results in a wet density of approximately 136 pcf. (Attachment C). Therefore, the overlying pressure is estimated as follows:

$$P = (93 \text{ ft})(136 \text{ pcf}) = 12{,}648 \text{ psf or } 606 \text{ kPa}$$

ANALYSIS

- **APPROACH – Protected Geomembrane**

Wilson-Fahmy, Narejo, and Koerner have evaluated puncture protection of geomembranes in a series of three papers. These papers are:

1) Wilson-Fahmy, R.F., Narejo, D., and Koerner, R.M (1996) "Puncture Protection of Geomembranes Part I: Theory", Geosynthetics International, Vol. 3, No. 5, pp. 605-628

2) Narejo, D., Koerner, RM. and Wilson-Fahmy, R.F. (1996) "Puncture Protection of Geomembranes Part II: Experimental", Geosynthetics International, Vol. 3, No. 5, pp. 629-653

3) Koerner, R.M., Wilson-Fahmy, R.F. and Narejo, D. (1996) "Puncture Protection of Geomembranes Part III: Examples", Geosynthetics International, Vol. 3, No. 5, pp. 655-675

These papers present an evaluation of geomembrane puncture theory, the results of a laboratory experimental program, and design examples in regards to puncture protection of geomembranes. The design methods and conclusions of these papers were used for the analysis herein.

According to these papers, the important parameters that affect the puncture protection of geomembranes are: overlying pressure, mass per area of the geotextile, and the particle size and shape of the material overlying the geotextile. For the analysis herein, the overlying pressure and the mass per unit area of the geotextile are given, and the maximum particle size is evaluated.

- **MASS PER UNIT AREA OF GEOTEXTILE**

Two different mass per unit areas will be evaluated. The cushion geotextile overlying the liner system will be 16 oz./SY and the GCL underlying the liner system will have geotextile components with a minimum 9 oz./SY mass per unit area. (Attachment D)

- **SIZING MAXIMUM PARTICLE OF SOIL**

Narejo et al (1996, Attachment E) present the following equation for evaluating geotextile puncture protection of 60 mil (1.5 mm) HDPE geomembrane:

$H^2 = 450\ M_A / P_{allow}$ (Attachment E)

where:

M_A = mass per unit area geotextile (g/m^2)
= 542 (16 oz./SY) and 305 (9 oz./SY) g/m^2

H = cone height (mm), which corresponds to predicted effective protrusion height, which equals one half maximum stone size (Attachment E).

P_{allow} = maximum long term allowable pressure

where: $P_{allow} = P'_{allow} (MF_S \times MF_{PD} \times MF_A)(FS_{CR} \times FS_{CBD})$ (Attachment E)

where: MF_S, MF_{PD}, MF_A = modification factors (discussed below)
FS_{CR}, FS_{CBD} = partial factor of safety values (discussed below)

P'_{allow} = allowable pressure based on field conditions
= (FS) ($P_{actual\ field\ pressure}$) (Attachment E)

where: FS = global factor of safety, 3.0 (Attachment E)
$P_{actual\ field\ pressure}$ = 606 kPa
P'_{allow} = (606)(3) = 1,818 kPa

MF_S = shape factor: (Attachment E)
1.0 (assume angular particles)

MF_{PD} packing density: (Attachment E)
0.5 (assume packed stones)

Written by: Rebecca Flynn Date: 06/08/21 (YY MM DD) Reviewed by: BTC Date: 06/11/3 (YY MM DD)

MF_A soil arching: (Attachment E)
0.75 (assume moderate)

FS_{CR} partial factor of safety for creep (Attachment E)
1.5 (see Table 12)

FS_{CBD} partial factor of safety for chemical and biological degradation
1.5 (based on average value) (Attachment E)

Solving for P_{allow} provides:

P_{allow} = (1,818) (1.0 x 0.5 x 0.75)(1.5 x 1.5)
P_{allow} = 1,534 kPa

Solving for H, the predicted effective protrusion height, provides:

$H^2 = 450\ M_A / P_{allow}$

$H_{cushion} = [(450)(M_A)/(1,534)]^{1/2}$
$M_A = 542\ g/m^2$ = 12.6 mm = 0.50 inches

$H_{GCL} = [(450)(M_A)/(1,534)]^{1/2}$
$M_A = 305\ g/m^2$ = 9.45 mm = 0.37 inches

The predicted effective protrusion height equals one half the maximum stone size. Therefore, the maximum stone size is twice the values listed above.

$M_A = 542\ g/m^2$ = 0.50 inches x 2 = 1.0 inches
$M_A = 305\ g/m^2$ = 0.37 inches x 2 = 0.75 inches

CONCLUSIONS

Assuming the following:

- the particle shape is angular for the drainage aggregate, and
- the approach presented by Wilson-Fahmy, Narejo, and Koerner for evaluating puncture protection of geomembranes is appropriate for the analysis herein,

then, the calculations suggest that THE MAXIMUM PARTICLE SIZE IS 1.0 IN. for a 16 oz/yd^2 geocomposite drainage layer and 0.75 IN. for a GCL with two geotextiles equating to 9 oz/yd^2.

ues using Equation 3. **Geomembrane showed signs of yield. † From short term cated cone puncture tests.

ORMULATION

n is presented in this section based on the experimental puncture previous sections. The resulting equations predict the allowable DPE geomembranes both with and without geotextile protection.

ure pressure based on the short term hydrostatic truncated cone test da A series odification factors are then applied to correlate the truncated cone actual d conditions. The modification factors consider the stone shape, arra ent and soil arching. All of these modification factors have a magnitude of 1.0 or less since the experiments were conducted on a worst-case basis. Partial factors of safety are then incorporated into the design equations to account for creep and chemical/biological degradation. These partial factors of safety are equal to 1.0 or greater since longer periods of time are typically required for these factors to have an effect. Finally, a global factor of safety is applied to account for uncertainties in the formulation. The above described empirical formulation is presented in a step-by-step manner in order to emphasize the various factors involved.

6.2 Basic Design Equation

The formulation for predicting geomembrane failure pressure, p, is based on Figure 3 where it is seen that for each cone height, the failure pressure varies linearly with respect to the mass per unit area of the geotextile. Note that this failure pressure from the experiments is assumed to be the maximum allowable design pressure with an implied global factor of safety of 1.0. Thus, the maximum allowable pressure can be expressed as follows:

$$p_{allow} = d \times M_A \tag{1}$$

where: p_{allow} = maximum allowable pressure (with an implied factor of safety of 1.0); M_A = mass per unit area of the protection geotextile (g/m^2); and d = constant. From Figure 3, it is found that the parameter d can be related to the cone height, H, according to the following equation:

$$d = \frac{450}{H^2} \tag{2}$$

where H is in millimeters.

Combining Equations 1 and 2, the failure pressure can be determined in terms of the cone height and mass per unit area of the protection geotextile as follows (a minimum pressure of 50 kPa is imposed which conservatively corresponds to the failure pressure of the 1.5 mm thick HDPE geomembrane without any protection material):

$$p_{allow} = 450 \frac{M_A}{H^2} \geq 50 \text{ kPa} \tag{3}$$

The accuracy of the above equation is depicted in Figure 6 which shows the relationship between the measured failure pressure and the failure pressure predicted using Equation 3. The data in Figure 6 are for polyester geotextiles made from cont s filaments, and polypropylene geotextiles made of staple fibers. Hence, Equatio s- plies to essentially all of the polymer and fiber types used in the nonwoven e- punched geotextiles.

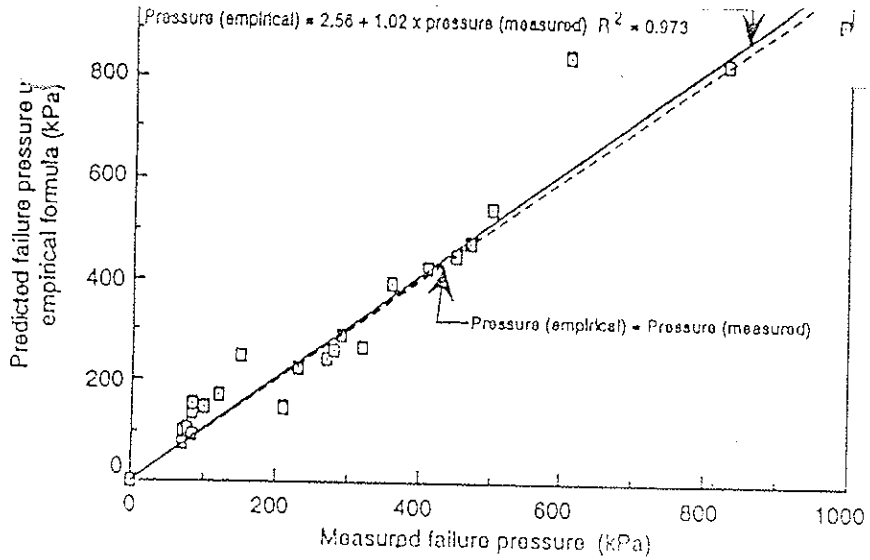

Figure 6. Measured versus empirically predicted failure pressures using Equation 3 for all nonwoven needle-punched geotextiles evaluated with a 1.5 mm thick HDPE geomembrane. Note: R = correlation coefficient.

6.3 Modification Factors

A series of modification factors is now sequentially applied to Equation 3 in order to arrive at a pressure representing field conditions. The modified pressure will be referred to as p'_{allow}.

6.3.1 *Modification Factor for the Protrusion Shape*

It was previously shown that the failure pressure depends on the protrusion shape. Rounded stones gave the highest failure pressure followed by subrounded stones. The lowest failure pressure is associated with angular stones and is approximately equal to the failure pressure of truncated cones. In order to account for the effect of stone shape, a modification factor is introduced into Equation 3 as follows:

$$p'_{allow} = p_{allow}\left(\frac{1}{MF_S}\right) \quad (4)$$

where MF_S is the modification factor for the protrusion shape. Hereafter, p'_{allow} refers to the empirically modified value of p_{allow} as is illustrated in Figure 6.

Based on the analysis of the data presented in Section 5.2.1, the modification factors for different stone shapes are presented in Table 9.

Stone shape	Modificati
Angular	
Subrounded	
Rounded	

6.3.2 *Modification Factor for Packing Density*

It is shown in Section 5.2.2 that the allowable pressure for higher than for isolated stones. Unfortunately, within the capac device, no failure could be achieved with the packed stones, a relation with isolated stones could be made. However, using presented in Part I of this series of papers (Wilson-Fahmy et a yield for packed stones ($R_o/H = 2$) could be compared with the lated stones ($R_o/H = 4$) where R_o is the horizontal distance from brane point of tangency with the protrusion tip to the undefor of tangency with the soil subgrade. The analysis was performed and without protection. Based on the results, a modification fa which provides a conservative estimate of the effect of packing 4 can be rewritten after introducing a modification factor for pac

$$p'_{allow} = p_{allow}\left(\frac{1}{MF_S \times MF_{PD}}\right)$$

where MF_{PD} is the modification factor for packing density. The sented in Table 10 can be used for isolated protrusions and pac

6.3.3 *Modification Factor for Soil Arching*

Equation 5 can be further modified as follows to include ing:

$$p'_{allow} = p_{allow}\left(\frac{1}{MF_S \times MF_{PD} \times MF_A}\right)$$

where MF_A is the modification factor for soil arching.

Table 10. Modification factors for packing density.

ion coefficient.

on Factors

ification factors is now sequentially applied to Equation 3 in order ure representing field conditions. The modified pressure will be re-

n Factor for the Protrusion Shape

shown that the failure pressure depends on the protrusion shape. ve the highest failure pressure followed by subrounded stones. The ure is associated with angular stones and is approximately equal to of truncated cones. In order to account for the effect of stone shape, or is introduced into Equation 3 as follows:

$$p'_{allow} = p_{allow}\left(\frac{1}{MF_S}\right) \tag{4}$$

modification factor for the protrusion shape. Hereafter, p'_{allow} refers modified value of p_{allow} as is illustrated in Figure 6.
ysis of the data presented in Section 5.2.1, the modification factors hapes are presented in Table 9.

Stone shape	Modification factor, MF_S
Angular	1.00
Subrounded	0.50
Rounded	0.25

6.3.2 *Modification Factor for Packing Density*

It is shown in Section 5.2.2 that the allowable pressure for packed stones is much higher than for isolated stones. Unfortunately, within the capacity of the experimental device, no failure could be achieved with the packed stones, and hence, no direct correlation with isolated stones could be made. However, using the theoretical analysis presented in Part I of this series of papers (Wilson-Fahmy et al. 1996), the pressure at yield for packed stones ($R_o/H = 2$) could be compared with the pressure at yield for isolated stones ($R_o/H = 4$) where R_o is the horizontal distance from a undeformed geomembrane point of tangency with the protrusion tip to the undeformed geomembrane point of tangency with the soil subgrade. The analysis was performed for geomembranes with and without protection. Based on the results, a modification factor of 0.5 is suggested which provides a conservative estimate of the effect of packing density. Thus, Equation 4 can be rewritten after introducing a modification factor for packing density as follows:

$$p'_{allow} = p_{allow}\left(\frac{1}{MF_S \times MF_{PD}}\right) \tag{5}$$

where MF_{PD} is the modification factor for packing density. The modification values presented in Table 10 can be used for isolated protrusions and packed stone arrangements.

6.3.3 *Modification Factor for Soil Arching*

Equation 5 can be further modified as follows to include the effect of soil arching:

$$p'_{allow} = p_{allow}\left(\frac{1}{MF_S \times MF_{PD} \times MF_A}\right) \tag{6}$$

where MF_A is the modification factor for soil arching.

Table 10. Modification factors for packing density.

Protrusion arrangement	Modification factor, MF_{PD}
Isolated protrusions	1.00
Packed stones	0.50

pressure by a factor of six in comparison with hydrostatic loading. This corresponds to a modification factor of 0.17. It may be noted, however, that the effect of soil arching on the pressure at yield may not be as great as the effect on the failure pressure. The deformations of the geomembrane up to yield may not be large enough to mobilize the soil arching effect; therefore, caution must be exercised when using the data in Table 7 for design. It is recommended that the values in Table 11 be used when soil arching is anticipated.

6.4 Partial Factors of Safety

After introducing the various modification factors (all of which are 1.0 or less), several partial factors of safety should be applied in order to determine the allowable pressure on the geomembrane. The partial factors of safety are equal to 1.0 or greater. Two factors are considered below, a partial factor of safety for long term creep and a partial factor of safety to account for long term chemical/biological degradation of the materials involved.

6.4.1 *Partial Factor of Safety for Creep*

A partial factor of safety for creep is incorporated into Equation 6, and the allowable pressure is now calculated as follows:

$$p'_{allow} = p_{allow}\left(\frac{1}{MF_S \times MF_{PD} \times MF_A}\right)\left(\frac{1}{FS_{CR}}\right) \qquad (7)$$

where FS_{CR} is the partial factor of safety for creep. Based on the creep data presented in Table 8, the recommended partial factors of safety for creep are given in Table 12.

This may be explained by the fact that, in the puncture ... the geo...membrane and its protection material will conform more to the subgra... ...ley creep and hence the unsupported length will decrease with time. It was shown in Part I of this series of papers (Wilson-Fahmy et al. 1996) that for the same applied pressure the maximum stress mobilized at the protrusion tip will decrease as the unsupported length decreases. Thus, a decrease in stress in the geomembrane and its protection material is expected with time. Accordingly, a lower factor of safety for creep is required for the puncture mode in comparison to the stress mode in which the material is subjected to a constant tensile stress.

6.4.2 *Partial Factor of Safety for Chemical/Biological Degradation*

The partial factor of safety against chemical/biological degradation, FS_{CBD}, is included in Equation 7 as follows:

$$p'_{allow} = p_{allow}\left(\frac{1}{MF_S \times MF_{PD} \times MF_A}\right)\left(\frac{1}{FS_{CR} \times FS_{CBD}}\right) \qquad (8)$$

Although not assessed in this study, the value of FS_{CBD} is felt to range between 1.0 and 2.0 with an average value of 1.5; see Koerner (1994) for discussion and details.

6.5 Global Factor of Safety

After determining an allowable pressure that is suitably adjusted for modification factors and partial factors of safety (Equation 8), a global factor of safety is determined by dividing the allowable pressure by the required pressure as follows:

$$FS = \frac{p'_{allow}}{p_{reqd}} \qquad (9)$$

where: p_{reqd} = maximum stress required on the geomembrane; and FS = desired global factor of safety for uncertainties related to site specific conditions.

It is felt that the global factor of safety should never be less than 3.0. Higher values may be used depending on site specific conditions. For example, a high factor of safety should be used in situations where large isolated stones are frequently encountered on the subgrade. Also, a tightly installed geomembrane may also require a larger global factor of safety compared to a geomembrane installed with slack. Furthermore, no modification has been included for in situ temperatures different from the test procedure temperature, i.e. ≈ 20°C. More definitive recommendations for the global factor of safety are made in Part III of this series of papers (Koerner et al. 1996).

SUMP CAPACITY
BRC CAMU
HENDERSON, NEVADA

OBJECTIVE

The objective of this calculation is to evaluate if the sump and leachate aggregate have the capacity to hold the maximum average daily volume (evaluated by the HELP model in the drainage pipe sizing calculation) without exceeding the 12-inch head requirement.

SUMMARY OF ANALYSIS

The HELP model suggest that the maximum, average daily volume collected by the leachate collection system is 231 cubic feet. The capacity of the sump and a "pool" of leachate 1 ft deep within the leachate collection system is 453 ft^3. Therefore, the sump and adjacent drainage geocomposite capacity exceeds the estimated maximum average daily leachate volume from the drainage pipe.

SITE CONDITIONS

The proposed composite liner system will be comprised of the following components, from top to bottom:

- 2 ft of operations layer material;
- a drainage geocomposite;
- 60-mil (1.5 mm) HDPE geomembrane, textured on both sides;
- a geosynthetic clay liner (GCL); and
- prepared subgrade.

The proposed base grading plans are shown on in Figure 1. A berm will be placed around the cells and within the cells to contain and control runoff during construction and during the worst case scenario when the cell contains a small quantity of waste. A sump will be located at the low point of each cell. Each sump will be approximately 10 ft x 10ft x 2 ft deep. The grade of the lining system immediately adjacent to the sumps ranges from 2 to 3%.

The Hydrologic Evaluation of Landfill Performance (HELP) model was used to estimate the peak daily quantity of liquid expected to be generated in the drainage layer during or after a rainfall

Client: BRC Project: BRC CAMU Project/Proposal No.: SC0313 Task No.: 04

event. The HELP model is used to evaluate the worst case scenario which occurs *during the period where the cell contains a small quantity of waste*, such that any collected liquid is considered leachate, yet the majority of the cell is empty so the largest quantity of liquid will infiltrate through the operations layer to the drainage layer. The output and assumptions of the HELP analyses are presented in the pipe sizing calculation package. It is assumed that surface runoff will be controlled, therefore this sump capacity calculation package compares the capacity of the sump to the quantity of leachate collected from the drainage layer.

ANALYSIS

Each sump will be approximately 10 ft x 10ft x 2 ft deep (see attachment). The side slopes of the sumps are proposed to be inclined at 2:1 (horizontal:vertical), although the calculation conservatively assumes side slopes of 1:1. The porosity (n) of the drainage aggregate is assumed to be 0.4 (HELP value for gravel). Therefore, the capacity of each sump is:

V_{sump} = [volume of square + volume of triangle around circumference]*porosity
V_{sump} = [10*10*2+(2*2)/2*40]*0.4 = 112 ft^3

Additional storage capacity within the drainage aggregate within the upgradient drainage collection layer is available provided that the leachate level does not exceed 12 inches over the liner (in order to remain compliant with 40 CFR 264.301(c)(2)).

The HELP model runs performed for the pipe sizing calculation indicates the following maximum average daily volumes:

Sump 1	169 ft^3
Sump 2	231 ft^3
Sump 3	65 ft^3

As Sump 2 has the largest peak daily volume of the four sumps, the capacity of the drainage aggregate will be analyzed for this sump. The plan view of Sump 2 is presented in Attachment A. For Sump 2, the slope of the drainage aggregate is assumed to be 2%. Therefore, for a 12-inch height of leachate, the edge of the "pool" of water is located at:

distance from sump = 1 ft / 0.02 = 50 ft.

Written by: Rebecca B. Flynn Date: 08/31/06 (MM/DD/YY) Reviewed by: GC Date: 11/03/06 (MM/DD/YY)

Client: BRC Project: BRC CAMU Project/Proposal No.: SC0313 Task No.: 04

Based on the topography of Sump 2, the grading from Sump 2 varies from 1 to 2 percent from the sump (Figure 1). Therefore, the 2% slope assumption is conservative.

The limits of the "pool" of water is assumed to have a radius of 50 ft from the sump (i.e., constant 2% slope). Again, this assumption is conservative (see attachment). The area of the "pool" around the sump is approximately 1,963 ft^2 as shown in the attachment. The capacity of this volume of drainage geocomposite and operation layer is approximately 342 ft^3, based on a maximum leachate depth of 12 inches and considering the porosity of the geocomposite and operations layer. Adding the volume within the sump yields a total capacity of 453 ft^3 (112 + 342 ft^3). The geometry for the other sumps is similar to Sump 2, and can be considered adequate to handle the estimated maximum average daily leachate volume.

SUMMARY AND CONCLUSIONS

- The sump capacity by itself is 112 ft^3; and
- The capacity of the drainage aggregate sloping at 2% away from the sump without exceeding the 1 ft head requirement is approximately 342 ft^3.
- The capacity of the sump and drainage aggregate far exceeds the maximum average daily volume evaluated from the HELP model (pipe size calculations) without exceeding 12 inches of head on the liner.

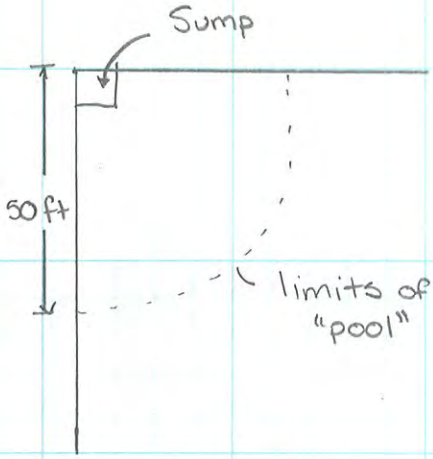
PLAN SUMP 2



To be conservative, and for ease of calculation, assume radius of +1 ft contour to be 50 ft from sump. Also, add volume directly above sump.

The area of the above "pool" is:

$A = (50\,ft)^2 \pi\ 90/360 = 1963\,ft^2$

The average depth of the leachate is 6" (mid-point of triangle shown on page 1). Therefore, the volume is:

$$V = (1963\,ft^2)\left[\left(\frac{0.2}{12}\right)(0.8) + \left(\frac{6-0.2}{12}\right)(0.3)\right]$$

(0.2/12: Thickness; 0.8: Porosity — Geocomposite; (6−0.2)/12: leachate level; 0.3: Porosity — Operations layer)

$V = 311\ ft^3$

The capacity of the geocomposite and operations layer directly above the sump is:

$$V_S = (\text{length})(\text{width})\left[\left(\frac{0.2}{12}\right)(0.8) + \left(\frac{12-0.2}{12}\right)(0.3)\right]$$

$V_S = 30.8\,ft^3$

Total Volume of voids for 1 ft "pool" of leachate is:

$342\,ft^3$

COMPARISON OF FLOW THROUGH THE PRESCRIPTIVE COMPOSITE LINER AND A PROPOSED ALTERNATIVE COMPOSITE LINER

OBJECTIVE

Evaluate an alternative composite lining system, consisting of a 60-mil HDPE geomembrane overlying a geosynthetic clay liner (GCL), to demonstrate equivalent or better fluid migration characteristics when compared with the prescriptive composite liner system, consisting of a 60-mil HDPE geomembrane overlying a compacted clay liner (CCL) having a saturated hydraulic conductivity less than 1×10^{-7} cm/s. The method outlined by Giroud, et al. (1997) will be employed to compare the fluid migration characteristics.

SUMMARY OF ANALYSIS

The calculations suggest that the flow rate through the prescriptive composite liner system is approximately 1.64 times greater than the flow rate through the alternative composite liner system. The fluid head on the geomembrane is assumed to be 12 in (305 mm), the maximum allowed as required in regulations 40 CFR §258.40(2).

In terms of limiting flow through the composite liner system, the alternative liner system performs better than the prescriptive liner system.

ANALYSIS

Liquid migration through a composite liner occurs essentially through defects of the geomembrane. According to Giroud, et al. (1997) (see Attachment 1), the rate of liquid migration through a defect in the geomembrane component of a composite liner is given by the following semi-empirical equation:

$$Q = 0.21[1+0.1(h/t)^{0.95}]\, a^{0.1}\, h^{0.9}\, k^{0.74} \qquad \text{Eq. (1)}$$

where:

Q = flow rate through one geomembrane defect, m^3/s
h = head of liquid above the geomembrane, m
t = thickness of soil component of composite liner, m
a = defect area, m^2
k = hydraulic conductivity of the soil component of composite liner, m/s

Written by: Geoff L. Smith Date: 01/25/00 (MM DD YY) Reviewed by: GTC Date: 07/03/00 (MM DD YY)

Client: Parsons Project: BRC CAMU Project/Proposal No.: HL0389 Task No.: 02

Using Eq. (1) the ratio between the rate of leachate flow through the prescriptive composite liner system and the alternative composite liner system can be compared as follows (Attachment 1):

$$\frac{q_{compCCL}}{q_{compGCL}} = \left(\frac{k_{CCL}}{k_{GCL}}\right)^{0.74} \frac{1+0.1(h/t_{CCL})^{0.95}}{1+0.1(h/t_{GCL})^{0.95}} \qquad \text{Eq. (2)}$$

where:

$q_{comp\ CCL}$ = unit rate of flow through a composite liner where soil component is a CCL
$q_{comp\ GCL}$ = unit rate of flow through a composite liner where soil component is a GCL

and other terms have previously been defined for Eq. (1).

EVALUATE FLOW THROUGH COMPOSITE LINER SYSTEMS

The values for the parameters in Eq. (2) are discussed below:

Properties of Compacted Clay Liner (CCL):

- $k_{CCL} = 1 \times 10^{-7}$ cm/s (the maximum hydraulic conductivity for the low-permeability soil component of the composite liner prescribed by 40 CFR §258.40(2))
- $t_{CCL} = 2$ ft (0.6 m) (minimum thickness prescribed by 40 CFR §258.40(2))

Properties of Geosynthetic Clay Liner (GCL):

- $k_{GCL} = 5 \times 10^{-9}$ cm/s (maximum hydraulic conductivity reported in manufacturer's documentation and typically allowed in technical specifications for GCLs)
- $t_{GCL} = 0.20$ in. (5 mm) (minimum thickness reported in manufacturer's documentation and typically allowed in technical specifications for GCLs)

Head Above Liner, (h):

40 CFR §258.40(2) states that the maximum allowable liquid head on a composite liner is less than 12 in. (305 mm).

Three cases comparing the flow rates through the prescriptive and alternative composite liner systems are evaluated using Eq. (2). The calculation is presented below:

Written by: Geoff L. Smith GLS Date: 01/25/00 (MM/DD/YY) Reviewed by: GTC Date: 04/03/00 (MM/DD/YY)

Client: Parsons Project: BRC CAMU Project/Proposal No.: HL0389 Task No.: 02

Calculation:

Plugging the above values for Case 1, Eq. (2) becomes as follows:

$$q_{comp\ CCL} / q_{comp\ GCL} = (1 \times 10^{-7} / 5 \times 10^{-9})^{0.74} [\ (1+0.1(12.0/24.0)^{0.95}) / (1+0.1(12.0/0.20)^{0.95}]$$
$$= 1.64$$

Thus, for a liquid head of 12.0 in. (305 mm) on the geomembrane, the flow through the prescriptive composite liner system that includes a CCL is 1.64 times greater than the flow through the alternative liner system that includes a GCL instead of a CCL.

SUMMARY AND CONCLUSIONS

- Using the method outlined by Giroud, et al. (1997), the flow rate through the prescriptive liner system (with CCL) was evaluated to be greater than the flow rate through the proposed alternative liner system (with GCL instead of CCL).

- The amount of flow through the prescriptive liner system was evaluated to be 1.64 times greater than flow through the alternative liner system for a leachate head of 12 in. (305 mm).

- In terms of limiting fluid flow through the composite liner system, the alternative liner system performs better than the prescriptive liner system.

4 FLOW THROUGH COMPOSITE LINERS

4.1 Introduction

As indicated in Section 2.8, GCLs used in landfills are always used as the low-permeability soil component of composite liners. In other words, GCLs used in landfills are always associated with a geomembrane. The cases discussed in Section 3 were only relevant to the extreme design scenario where the geomembrane is ignored, and to other containment structures where GCLs may be used without a geomembrane.

In Section 4, the geomembrane is not ignored and the effectiveness of composite liners constructed with CCLs and GCLs is compared.

4.2 Rate of Leachate Migration Through Composite Liners With CCL and GCL

Development of Equation. As indicated by Giroud and Bonaparte (1989), liquid migration through a composite liner occurs essentially through defects of the geomembrane. According to Giroud (1997), the rate of liquid migration through a defect in the geomembrane component of a composite liner is given by the following semi-empirical equation:

$$Q = 0.21\,[1 + 0.1(h/t)^{0.95}]\,a^{0.1}\,h^{0.9}\,k^{0.74} \tag{51}$$

where: Q = flow rate through one geomembrane defect; h = head of liquid above the geomembrane; t = thickness of the soil component of the composite liner; a = defect area; and k = hydraulic conductivity of the soil component of the composite liner. It is important to note that Equation 51 can only be used with the following units: a (m^2), h (m), t (m), k (m/s).

As discussed in Sections 2.5 and 2.6, there are cases where it is prescribed by regulations, or simply envisioned by design engineers, to place a GCL on a layer of soil with a low hydraulic conductivity such as 1×10^{-8} or 1×10^{-7} m/s. An important conclusion from Section 3, is that, if a GCL is placed on a soil layer (even a soil layer with low permeability), the soil layer has no influence on leachate advective flow and only the GCL should be considered in leachate flow calculations. The same conclusion applies to the soil component of a composite liner. Accordingly, if, in a composite liner, a GCL is placed on a layer of low-permeability soil, only the GCL will be considered in Equation 51.

Using Equation 51, the ratio between the rate of leachate flow through a composite liner with a CCL and a composite liner with a GCL is as follows:

$$\frac{q_{comp\,CCL}}{q_{comp\,GCL}} = \frac{0.21\,N\,[1 + 0.1(h/t_{CCL})^{0.95}]\,a^{0.1}\,h^{0.9}\,k_{CCL}^{0.74}}{0.21\,N\,[1 + 0.1(h/t_{GCL})^{0.95}]\,a^{0.1}\,h^{0.9}\,k_{GCL}^{0.74}} \tag{52}$$

where: $q_{comp\,CCL}$ = unit rate of flow through a composite liner where the soil component is a CCL; $q_{comp\,GCL}$ = unit rate of flow through a composite liner where the soil component is a GCL; t_{CCL} = thickness of the CCL in the composite liner; t_{GCL} = thickness of the GCL

ATTACHMENT A
P 2/2 MW

in the composite liner; and N = number of geomembrane defects per unit area. After simplification, Equation 52 becomes:

$$\frac{q_{comp\ CCL}}{q_{comp\ GCL}} = \left(\frac{k_{CCL}}{k_{GCL}}\right)^{0.74} \frac{1 + 0.1(h/t_{CCL})^{0.95}}{1 + 0.1(h/t_{GCL})^{0.95}} \qquad (53)$$

Discussion. It appears that the leachate flow rate ratio expressed by Equation 53 does not depend on the number and the size of defects. Numerical values of $q_{comp\ CCL}/q_{comp\ GCL}$ calculated using Equation 53 are presented in Table 7. It appears that, for leachate heads typically encountered in landfills (i.e. heads smaller than 0.3 m, and generally smaller than 0.1 m), the calculated advective flow control performance of a composite liner which consists of a geomembrane on a GCL is significantly better than the calculated advective flow control performance of the standard composite liner which consists of a geomembrane on the standard CCL (i.e. a CCL with a thickness of 0.6 m and a hydraulic conductivity of 1×10^{-9} m/s). Table 7 also shows that a composite liner with a GCL outperforms the standard composite liner for leachate heads up to approximately 1 to 7 m depending on the GCL hydraulic conductivity; such large heads should be a very rare occurrence in a landfill since they would correspond to a major malfunction of the leachate collection and removal system.

Table 7. Ratio between rates of advective flow through a composite liner including a CCL and a composite liner including a GCL, $q_{comp\ CCL}/q_{comp\ GCL}$.

Notes: The tabulated values of the advective flow rate ratio were calculated using Equation 53 with the following CCL characteristics: thickness, t_{CCL} = 0.6 m; and hydraulic conductivity, $k_{CCL} = 1 \times 10^{-9}$ m/s. (This is the standard CCL defined in Section 2.5.) The characteristics of the GCL are from Table 2.

GEOTEXTILE TENSION DUE TO WIND UPLIFT
BRC LANDFILL
HENDERSON, NEVADA

OBJECTIVE

Evaluate tension in a woven geotextile due to wind uplift. Use method outlined by Giroud, et al (1995). Tension generated by wind uplift will be compared to the anchor trench capacity and the ultimate strength of the woven geotextile.

SITE CONDITIONS

The side slope liner system considered in the wind uplift calculation consists (from top to bottom) of:

- woven geotextile U.V. protection layer
- geocomposite;
- 60-mil HDPE geomembrane
- GCL

The capacity of the anchor trench is determined in a separate calculation package.

ANALYSIS

The analysis will follow the method outlined by Giroud, et al, in "Uplift of Geomembrane by Wind" (Attachment A). Giroud et al offer the following equation for estimating the effective suction on a geomembrane (Attachment A):

$$S_E = 0.050\lambda V^2 e^{-[1.252E-4]z} - 9.81M_{GM} \qquad \text{(Equation 1)}$$

where: S_E = effective suction (P_a)
λ = suction factor (dimensionless)
V = wind velocity (km/h)
z = altitude above sea level (m)
M_{GM} = mass per unit area of geomembrane (kg/m^2)

Written by: Geoff L. Smith Date: 00/01/26 (YY MM DD) Reviewed by: GTC Date: 00/07/03 (YY MM DD)

Client: Parsons Project: BRC Landfill Project/Proposal No.: HL0389 Task No.: 01

Evaluate Variables

λ Suction factor = 0.85 for the upper third of the slope being considered

V wind velocity = 90 mph = 145 km/h (the peak gust ever recorded after 1961, see Attachment B)

z altitude above sea level (m). A representative elevation for the base side slopes is approximately 1760 ft = 536 m

M_{GM} mass per unit area of geotextile (kg/m^2)
$M_{GM} = 0.15\ kg/m^2$ (Attachment C)

Evaluate Suction

$S_E = (0.05)(0.85)(145)^2\ e^{-(1.252E-4)536} - 9.81(0.15) = 834\ Pa$

The height of the exposed slope (2.1H:1V) after the first phase of operations layer is placed is 20 vertical feet, so the total length of exposed slope, L, is $L/\sin\beta$ = 46.5 ft = 14.2 m

$S_E L = (821)(14.2) = 11.84\ kN/m$

Evaluate Tension

The objective of this case is to evaluate tension in the geomembrane. Assuming the geomembrane stress-strain curve is linear, the tension can be expresses as:

$$T = J\varepsilon$$

where: T = tension
J = stiffness
ε = strain

To evaluate the tension in the geomembrane, the stiffness and stain must be evaluated.

Written by: Geoff L. Smith Date: 00/01/26 (YY MM DD) Reviewed by: GTC Date: 00/07/03 (YY MM DD)

Client: Parsons Project: BRC Landfill Project/Proposal No.: HL0389 Task No.: 01

Stiffness, J

For strains typically less than 10 percent, the stress-strain curve for woven geotextiles is approximately linear. Therefore, stiffness can be approximated as:

$$J = ET_{GT}$$

where: E = elastic modulus = 1535 kN/m (Koerner 1994)
T_{GM} = geotextile thickness, approximately 5 mils (Koerner 1994)

$J = (1535 \text{ MPa})(0.000127 \text{ m}) = 195 \text{ kN/m}$

Strain, ε

The strain on the woven geotextile induced by wind uplift loading can be estimated using the table by Giroud et al. (Attachment A).

$$\text{For } \frac{J}{S_E L} = \frac{195}{11.84} = 16.7$$

from Table 4, ε = 5.57%

The estimated strain in the woven geotextile is 5.57% percent, so the assumption of a linear stress-strain relationship is valid.

Evaluate tension

$$\mathbf{T} = 195\frac{5.57\%}{100} = \mathbf{10.9 \text{ kN/m}}$$

GEOTEXTILE ALLOWABLE TENSION

Since the woven geotextile (for U.V. protection) will be subjected to wind uplift forces, the woven geotextile will be designed for tension.

The estimated tensile force imposed on the geomembrane due to wind uplift suction is 14.5 kN/m for a design wind speed of 90 mph (145 kph). To account for uncertainties in the woven geotextile ultimate strength and wind speed, a factor of safety of 1.5 will be employed.

Written by: Geoff L. Smith Date: 00/01/26 (YY MM DD) Reviewed by: GTC Date: 00/07/03 (YY MM DD)

Client: Parsons Project: BRC Landfill Project/Proposal No.: HL0389 Task No.: 01

Therefore, the required ultimate strength of the geotextile shall be greater than or equal to 16 kN/m (91 ppi).

CONCLUSIONS

Based on the results herein, the woven geotextile U.V. protection layer shall have a wide width ultimate tensile strength greater than or equal to 16 kN/m (91 ppi).

The capacity of the anchor trench is determined in a separate calculation package.

$$T = J\varepsilon \tag{34}$$

where: T = geomembrane tension; J = geomembrane tensile stiffness; and ε = geomembrane strain. The case of geomembranes with a linear tension-strain curve will be further discussed in Section 3.5.

It is important to note that geomembranes that are not reinforced with a fabric, for example PVC and PE geomembranes, have tensile characteristics that are highly dependent on temperature. Extensive data on the influence of temperature on the tensile characteristics of HDPE geomembranes are provided by Giroud (1994). The influence of temperature will be further discussed in Section 3.6.

3.2.3 *Suction Due to Wind*

In the subsequent analysis, the suction applied by the wind is assumed to be uniform over the entire length L. In reality, the suction due to the wind is not uniformly distributed as shown in Figure 4. Therefore, the design engineer using the method presented in this paper must exercise judgment in selecting the value of the length L and the value of the ratio λ defined by Equation 13.

In accordance with the discussions presented in Sections 2.3 and 2.4, the suction that effectively uplifts the geomembrane is:

$$S_e = S - \mu_{GM} g \tag{35}$$

where S_e is the "effective suction".

Combining Equations 2, 13 and 35 gives:

$$S_e = \lambda \rho V^2/2 - \mu_{GM} g \tag{36}$$

Combining Equations 3 and 36 gives:

$$S_e = \lambda \rho_o (V^2/2) e^{-\rho_o g z/p_o} - \mu_{GM} g \tag{37}$$

Using the values of ρ_o and p_o given in Section 2.1 and $g = 9.81$ m/s^2, Equation 37 gives:

- At sea level:

$$S_e = 0.6465 \lambda V^2 - 9.81 \mu_{GM} \tag{38}$$

with S_e(Pa), V(m/s), μ_{GM}(kg/m^2)

$$S_e = 0.050 \lambda V^2 - 9.81 \mu_{GM} \tag{39}$$

with S_e(Pa), V(km/h), μ_{GM}(kg/m^2)

with S_e(Pa), V(m/s), z(m), μ_{GM}(kg/m^2)

$$S_e = 0.050\lambda V^2 e^{-(1.252 \times 10^{-4})z} - 9.81\mu_{GM} \quad (41)$$

with S_e(Pa), V(km/h), z(m), μ_{GM}(kg/m^2)

3.3 Determination of Geomembrane Tension and Strain

According to Equation 36, the effective suction results from two components: a component due to the wind-generated suction, which is normal to the geomembrane; and a component due to the geomembrane mass per unit area, which is not normal to the geomembrane. The component due to the geomembrane mass per unit area is generally small compared to the component due to the wind-generated suction. Therefore, the effective suction is essentially normal to the geomembrane. Since the effective suction is taken as normal to the geomembrane and has been assumed to be uniformly distributed over the length L of geomembrane, and since the problem is considered to be two-dimensional (see Section 3.2.2), the cross section of the uplifted geomembrane has a circular shape (Figure 9). As a result, the resultant F of the applied effective suction is equal to the effective suction multiplied by the length of chord AB, i.e. L:

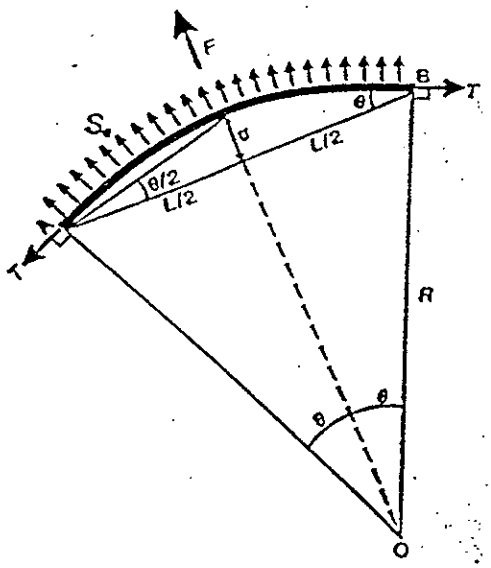

Figure 9. Schematic representation of uplifted geomembrane used for developing equations.

EVALUATION OF LINER SYSTEM ANCHOR CAPACITY
BRC CAMU
HENDERSON, NEVADA

OBJECTIVE

The objective of this calculation package is to evaluate the tensile strength capacity for anchorage of the liner system at termination locations of the liner system with respect to wind uplift forces on the U.V. protective woven geotextile. One liner termination detail will be evaluated for the BRC CAMU.

SITE CONDITIONS

The proposed design for the BRC CAMU consists of a trench located a minimum of 3 ft from the crest of the slope. The width and depth of the trench is 2 ft and 2.5 ft, respectively. During the period of wind uplift exposure, there will be a 1 ft (0.3 m) high overburden placed above the anchor trench. The geosynthetic anchorage design is presented in Figure 1.

METHOD OF ANALYSIS

Koerner (1994) presents design equations developed from static equilibrium to evaluate the allowable geosynthetic tension from an anchor trench. The equation considers frictional resistance due to (i) overburden pressures, (ii) anchor trench side slopes, and (iii) base of the anchor trench. The proposed design equation for determination of the allowable geomembrane tension from an anchor trench is:

$$T_{allow} = F_U + F_L + F_{AT\text{-}SIDE1} + F_{AT\text{-}SIDE2} + F_{AT\text{-}BASE1} + F_{AT\text{-}BASE2} \quad (1)$$

Where: T_{allow} = Allowable tensile force in the geotextile;

F_U = Friction force above the geotextile;

F_L = Friction force below the geotextile;

$F_L = q\tan\delta(L_{RO})$

q = surcharge pressure due to soil overburden

δ = minimum friction angle between liner system interfaces and the soil

L_{RO} = Runout length

$F_{AT\text{-}SIDE}$ = Friction force due to the side of the anchor trench;

$F_{AT\text{-}SIDE} = (\sigma_h)_{ave} \tan\delta(d_{AT})$

$(\sigma_h)_{ave}$ = average horizontal stress in the anchor trench = $K_o\sigma_v$

d_{AT} = depth of the anchor trench

K_o = coefficient of earth pressure at rest, = $(1\text{-}\sin\phi)$

σ_v = vertical overburden stress (at average depth of the anchor trench)

$F_{AT\text{-}BASE}$ = Friction force due to the base of the anchor trench;

$F_{AT\text{-}BASE} = q\tan\delta(L_{AT})$

L_{AT} = width of the anchor trench

ANALYSIS

Evaluating Variables

Since tension will develop in the U.V. protective layer (see the calculation package *Tension due to Wind Uplift*), frictional forces of the U.V. protective layer woven geotextile will be mobilized along the geosynthetic and soil interfaces on the side and base of the anchor trench. For the analysis presented herein:

- A friction angle of 8 degrees will be used to represent the friction angle between the geocomposite (non-woven geotextile side) and the woven geotextile. (Attachment 1 presents a typical friction angle between a non-woven geotextile and a *smooth* HDPE sheet as 8 degrees. The interface between a woven geotextile and the non-woven geotextile will be higher due to the slit film and raised surfaces of the woven geotextile. Therefore, it is conservative to assume a friction angle of 8 degrees);

- A friction angle of 26 degrees to represent the soil/ woven geotextile interface. (Attachment 1 presents typical efficiency values between woven and soil interfaces. The typical efficiency is on the order of 85 percent. The anchor trench soil compacted to 90 % modified proctor will have a friction angle on

Written by: Geoff L. Smith Date: 01/27/00 (MM DD YY) Reviewed by: _____ Date: ___/___/___ (MM DD YY)

Client: Parsons Project: BRC CAMU Project No.: HL0389 Task No.: 01

the order of 30 degrees - see final slope stability calculation package. Therefore, the interface friction angle is $\tan^{-1}(0.85*\tan(30))$=26 deg.).

For determination of the surcharge due to soil overburden, q, and the vertical and horizontal overburden stresses, σ_h and σ_v, a unit weight of overburden soil of 136 pcf was assumed (γ = 136 pcf). For evaluation of the effective horizontal overburden stress based on the coefficient of earth pressure at rest, a friction angle of 30° was assumed for the cover soil.

Analysis

From Equation (1):

$$T_{allow} = F_U + F_L + F_{AT\text{-}SIDE1} + F_{AT\text{-}SIDE2} + F_{AT\text{-}BASE1} + F_{AT\text{-}BASE2}$$

F_U = $q\tan\delta(L_{RO})$
= 1 ft (136 pcf) tan 8°(2 ft)
= 38.2 lb/ft

F_L = $q\tan\delta(L_{RO})$
= 1 ft (136 pcf) tan 26°(2 ft)
= 132.7 lb/ft

$F_{AT\text{-}SIDE1}$ = $(\sigma_h)_{ave}\tan\delta(d_{AT}) = Ko(\sigma_v)_{ave}\tan\delta(d_{AT})$
= (1-sin30°)(2.25 ft)(136 pcf)tan8°(2.5 ft)
= 53.8 lb/ft

$F_{AT\text{-}SIDE2}$ = $(\sigma_h)_{ave}\tan\delta(d_{AT}) = Ko(\sigma_v)_{ave}\tan\delta(d_{AT})$
= (1-sin30°)(2.25 ft)(136 pcf)tan26°(2.5 ft)
= 186 lb/ft

$F_{AT\text{-}BASE1}$ = $q\tan\delta(L_{AT})$
= (3.5ft)(136 pcf)(tan8°)(2 ft)
= 133.8 lb/ft

Written by: Geoff L. Smith Date: 01/27/00 (MM DD YY) Reviewed by: GTC Date: 09/03/00 (MM DD YY)

Client: Parsons Project: BRC CAMU Project No.: HL0389 Task No.: 01

$$F_{AT\text{-}BASE2} = q\tan\delta(L_{AT})$$
$$= (3.5\text{ft})(136\text{ pcf})(\tan 26^{\circ})(2\text{ ft})$$
$$= 464\text{ lb/ft}$$

$$T_{allow} = F_U + F_L + F_{AT\text{-}SIDE1} + F_{AT\text{-}SIDE2} + F_{AT\text{-}BASE1} + F_{AT\text{-}BASE2}$$
$$= 38.2 + 132.7 + 53.8 + 186 + 134 + 464$$
$$\mathbf{T_{allow} = 1{,}008\text{ lb/ft} = 14.7\text{ kN/m}}$$

CONCLUSIONS

The allowable tensile capacity of the anchorage system as calculated herein (as T_{allow}) exceeds the expected wind uplift tensile loads (from the calculation package entitled *Evaluation of Tension due to Wind Uplift*). The expected tensile load due to wind uplift was evaluated to be 10.9 kN/m. Since the design wind speed is the maximum peak gust recorded (90 mph), the required factor of safety against anchorage pullout is greater than 1.0. Therefore, the anchor capacity is adequate.

Based on the methods employed herein, results of analysis indicates that the design anchorage evaluated provides adequate tensile capacity to resist the U.V. protective geotextile tension induced by wind uplift forces.

SECTION
ANCHOR TRENCH
1" = 2'

Figure 1

Solution: From the design equations just presented,

$$T \cos \beta = 350\ (144)(0.030/12) \cos 18.4$$
$$= 120 \text{ lb./ft.}$$
$$T \sin \beta = 39.8 \text{ lb./ft.}$$
$$q_L = d_{CS}\, \gamma_{CS}$$
$$= (1.0)\ (100)$$
$$= 100 \text{ lb./ft.}^2$$

which, when substituted into Equation 5.27, gives

$$T \cos \beta = q_L \tan \delta\ (L_{RO}) + T \sin \beta \tan \delta$$
$$120 = 100 \tan 20\ (L_{RO}) + 39.8 \tan 20$$
$$120 = 36.4 L_{RO} + 14.5$$
$$L_{RO} = 2.9 \text{ ft.; use } 3.0 \text{ ft.}$$

Note that this value is strongly dependent on the value of mobilized allowable stress used in the analysis. To mobilize the full strength of the geomembrane would require a longer runout length or an anchor trench. This, however, might not be desirable. Pullout, without geomembrane failure, might be a preferable phenomenon. It is a site-specific situation.

The situation with an anchor trench at the end of the runout section is illustrated in Figure 5.31. The configuration requires some important assumptions regarding the state of stress within the anchor trench and its resistance mechanism. To establish static equilibrium, Daniel [41] has suggested using an imaginary and frictionless pulley as shown in Figure 5.31, which allows for the geomembrane to be considered in its continuous form.

$$T_{allow} = F_U + F_L + 2\, F_{AT} \tag{5.28}$$

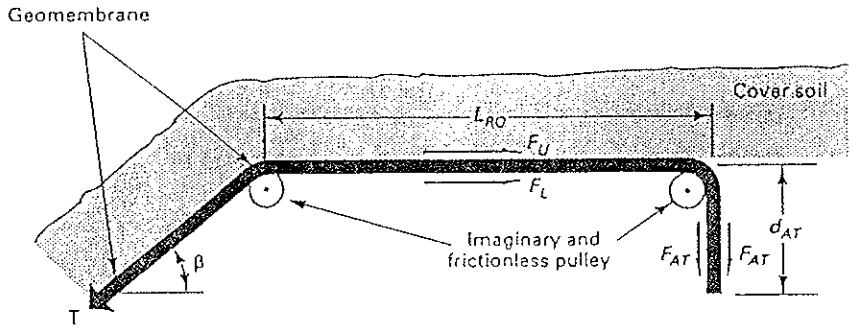

Figure 5.31 Cross section of geomembrane runout section with anchor trench and related stresses and forces involved.

where $T_{allow} = \sigma_{allow}\, t$, in which
σ_{allow} = the mobilized allowable geomembrane stress = σ_{ult}/FS,
σ_{ult} = the ultimate geomembrane stress (e.g., yield or break),
FS = the factor of safety, and
t = the geomembrane thickness,
F_U = the friction force above geomembrane (assumed to be negligible, since the cover soil probably moves along with the liner as it deforms),
$F_L = q \tan \delta\ (L_{RO})$, in which
q = the surcharge pressure = $d_{CS}\, \gamma_{CS}$,
d_{CS} = the depth of cover soil,
γ_{CS} = the unit weight of cover soil,
δ = the friction angle between geomembrane and soil, and
L_{RO} = (unknown) length of runout, and
$F_{AT} = (\sigma_h)_{ave} \tan \delta\ (d_{AT})$, in which
σ_h = the average horizontal stress in anchor trench = $K_O\, \sigma_V$,
$\sigma_V = \gamma\, H_{ave}$,
γ = the unit weight of backfill soil,
H_{ave} = the average depth of anchor trench (requires an estimate),
$K_O = 1 - \sin \phi$,
ϕ = the angle of shearing resistance of backfill soil, and
d_{AT} = the (unknown) depth of anchor trench.

This situation results in one equation with two unknowns; thus a choice of either L_{RO} or d_{AT} is necessary to calculate the other. As with the previous situation, the factor of safety is placed on the geomembrane force T, which is used as an allowable value (i.e., T_{allow}). An example illustrates the procedure.

Example:

Repeat the previous problem of a 30-mil VLDPE geomembrane of allowable stress 350 lb./in.^{2} on a 3(H) to 1(V) side slope. There is a 12-in. cover soil placed over the geomembrane weighing 100 lb./ft.^{3} (also the unit weight of the backfill soil). The friction angle between the liner and soil is 20 deg. and the soil itself is 30 deg. Determine the required length of runout for a 12-in.-deep anchor trench and for a zero-depth anchor trench to check the preceding example.

Solution: Using the previously developed design equations based on Figure 5.31,

$$T_{allow} = F_U + F_L + 2F_{AT}$$

$$\sigma_{allow}(t) = 0 + q \tan \delta\,(L_{RO}) + 2(K_O \sigma_{V_{ave}}) \tan \delta (d_{AT})$$

$$(350 \times 144)\left(\frac{0.030}{12}\right) = 0 + (1.0)(100) \tan 20(L_{RO}) + 1.5(0.5)(2.0 \times 100) \tan 20(d_{AT})$$

$$126 = 36.4 L_{RO} + 56.6 d_{AT}$$

Source: After Martin et al. [14].

The frictional behavior of geomembranes placed on clay soils is of considerable importance in the composite liners of waste landfills. Current requirements are for the clay to have a hydraulic conductivity equal to or less than 2×10^{-7} ft./min. (1×10^{-7} cm/sec.) and for the geomembrane to be placed directly on the clay. While an indication of the shear strength parameters has been investigated (e.g., reference 15), the data are so sensitive to the variables listed previously that site-specific and material-specific tests should always be performed. In such cases, literature values should never be used for final design purposes.

5.1.3.9 Geomembrane Anchorage In certain problem situations a geomembrane might be sandwiched between two materials and then tensioned by an external force. The termination of a geomembrane liner within an anchor trench is such a situation. To simulate this behavior in a laboratory environment, one can use an 8.0-in. (200-mm)-wide geomembrane sandwiched between back-to-back channels.

DRAINAGE COMPOSITE EQUIVALENCY DEMONSTRATION
BRC CAMU
HENDERSON, NEVADA

OBJECTIVE

The objective of this analysis is to evaluate the hydraulic performance of a drainage composite, and compare it to the prescriptive leachate collection layer, consisting of drainage aggregate, within the BRC CAMU. A drainage composite, consisting of two 8 oz/sy nonwoven geotextiles bonded to either side of a geonet, is proposed. This analysis will demonstrate equivalence or performance exceedance of the drainage composite to the prescriptive 1-foot thick (0.3m) aggregate drainage layer. The method of analysis will compare the current transmissivity of the aggregate drainage layer and the equivalent transmissivity of the drainage composite.

SUMMARY OF ANALYSIS

The calculations suggest that a drainage composite having a transmissivity of $6.1*10^{-5}$ m^2/sec, at a maximum stress of 12,000 psf (574 kN/m^2) and a hydraulic gradient of ~~0.02~~ 0.10 GLS, will provide equivalence to the aggregate drainage layer.

METHOD OF ANALYSIS

The analysis was performed using procedures recommended by Koerner (1994). The procedure first evaluates the flow rate (transmissivity) through the aggregate drainage layer, using the basic flow equation described by Darcy, and then calculates the equivalent flow rate (transmissivity) of the drainage composite, and includes appropriate partial factors of safety for geosynthetic materials.

ANALYSIS

This calculation evaluates the flow rate within the drainage composite.

- **FLOW RATE (TRANSMISSIVITY) OF THE AGGREGATE DRAINAGE LAYER**

The maximum flow rate within the leachate collection zone is determined from Darcy's Law by the equation:

$$q = K\,i\,A$$

Written by: Geoff L. Smith Date: 00/06/28 (YY/MM/DD) Reviewed by: GTC Date: 00/07/03 (YY/MM/DD)

Client: Parsons Project: BRC CAMU Project/Proposal No.: HL0389 Task No.: 02

where:

q = flow rate within the leachate collection layer (m^3/sec)
K = hydraulic conductivity (m/sec)
i = hydraulic gradient (dimensionless)
A = area of flux (m^2)

The following properties will be used for the aggregate drainage layer material.

$K = 1*10^{-2}$ cm/sec = $1*10^{-4}$ m/sec.
i = 0.02 (minimum slope of base liner system)
A= (1 ft * 1 ft) = 1 ft^2 = 0.093 m^2

The hydraulic conductivity is the prescriptive minimum value for the aggregate drainage layer, and the hydraulic gradient is a function of the minimum base slope of the cell. The area of flux is based on the unit thickness of the aggregate drainage layer (1 foot minimum).

Therefore,

$q_{req} = (1*10^{-4}$ m/sec.)(0.02)(0.093 m^2)
$= 1.86*10^{-7}$ m^3/sec

This maximum flow rate through the aggregate drainage layer, is the required flow through the drainage composite (q_{req}).

The allowable flow rate is obtained from laboratory testing for design purposes. This value is determined using appropriate safety factors against the required flow rate. The factor of safety is expressed as the ratio of the allowable flow rate (q_{all}) to the required flow rate (q_{req}).

$$FS = q_{all} / q_{req}$$

Similarly, the factor of safety equation can be expressed as the ratio of allowable to required in plane flow, transmissivity (θ), where the factor of safety equals:

$$FS = \theta_{all} / \theta_{req}$$

Where the transmissivity is calculated by:

$$\theta_{req} = q_{req} / (i*W)$$ (Attachment A)

Written by: Geoff L. Smith Date: 00/06/28 (YY MM DD) Reviewed by: GTC Date: 00/07/03 (YY MM DD)

Client: Parsons Project: BRC CAMU Project/Proposal No.: HL0389 Task No.: 02

W = unit width of the drainage layer = 1 ft = 0.3408 m

Therefore,

$$\theta_{req} = \frac{(1.86*10^{-7}\ m^3/sec)}{(0.3048m)(0.02)}$$

$$= 3.05*10^{-5}\ m^2/sec.$$

The transmissivity of the aggregate drainage layer then becomes the minimum required transmissivity (θ_{req}) of the drainage composite.

- **TRANSMISSIVITY OF THE DRAINAGE COMPOSITE**

To ensure that the transmissivity of the proposed drainage composite meets or exceeds the required values over the life of the landfill, the required transmissivity must be increased through the use of appropriate partial factors of safety. These partial factors of safety make the adequate adjustment between the laboratory transmissivity values for drainage composite and actual field conditions.

As seen in Attachment A, Koerner suggests four factors of safety which should be accounted for: the intrusion of the adjacent geotextile into the core of the geonet (FS_{IN}), creep deformation of the geonet (FS_{CR}), factor of safety against chemical clogging of the geonet (FS_{CC}), and factor of safety against biological clogging of the geonet (FS_{BC}). Partial factor of safety values were applied to the geotextile in the filtration geotextile calculation to account for flow through the geotextile component of the drainage composite.

Attachment A shows the ranges for the partial factors of safety. For the purposes of the calculations made, the factors of safety were assumed to be:

FS_{IN} = 1.0 (Accounted for during the testing of the drainage composite)
FS_{CR} = 2.0
FS_{CC} = 1.0 (Accounted for in the Filter Calculation)
FS_{BC} = 1.0 (Accounted for in the Filter Calculation)

The ultimate transmissivity of the drainage composite then becomes:

$$\theta_{ultimate} = \theta_{req} * (\Sigma\ FS)$$

Written by: Geoff L. Smith GLS Date: 00 / 06 / 28 (YY MM DD) Reviewed by: GTC Date: 00/07/03 (YY MM DD)

Client: Parsons Project: BRC CAMU Project/Proposal No.: HL0389 Task No.: 02

Σ FS = product of all the partial factors of safety for the site specific conditions

The ultimate transmissivity of the drainage composite is then calculated as:

$\theta_{geonet} = \theta_{req} * (\Sigma FS) = 3.05*10^{-5}$ m^2/sec [1.0*2.0*1.0*1.0]

$= 6.1*10^{-5}$ m^2/sec

- **MAXIMUM STRESS**

The maximum height of the waste fill is 60 ft (18.3 m). Assuming a unit weight of 136 pcf and a factor of safety of 1.5, this translates to a overburden stress of approximately 12,000 psf (574 kPa).

- CONCLUSIONS

The required transmissivity of the geocomposite shall be $6.1*10^{-5}$ m^2/sec at a maximum stress of 12,000 psf and a gradient of ~~0.02~~ 0.10 GLS.

GTC

transportation-related systems, such as roads and walls, the problem does not appear to be too serious. In waste leachate related systems (e.g., landfill leachate collection systems), it might be another story. At the bottom of a landfill, temperatures are high, ample carbon (as a biological food source) is available, and bacteria and fungi could indeed thrive. Whether oxygen is available or not only dictates whether aerobic or anaerobic conditions prevail. No data regarding microorganisms in geonets are presently available, although research is currently ongoing. Procedurally, one must use a high flow rate factor of safety, or have systems designed so that flushing is possible. This area begs for future inquiry.

The last environmental consideration, resistance to light and weather, is not felt to be a serious concern for most situations in which geonets are used. Polyethylene is resistant to weather-related degradation, and carbon black is included in all of the known products. Nevertheless geonets should be covered as soon as possible after placement.

4.1.6 Allowable Flow Rate

As described previously, the essence of the design-by-function concept is the establishment of an adequate global factor of safety. For geonets, where flow rate is the primary function, this takes the following form:

$$FS = \frac{q_{allow}}{q_{req}} \tag{4.3}$$

where FS = the global factor of safety (to handle unknown loading conditions or uncertainties in design methods, etc.),
q_{allow} = the allowable flow rate as obtained from laboratory testing, and
q_{req} = the required flow rate as obtained from design of the actual system.

Alternatively, one could also work from a transmissivity basis to obtain the equivalent relationship.

$$FS = \frac{\theta_{allow}}{\theta_{req}} \tag{4.4}$$

where θ is the transmissivity under similar definitions as above. As described previously, however, it is preferable to design with flow rate rather than transmissivity because of nonlaminar flow conditions in geonets.

Concerning the allowable value, which comes from hydraulic testing of the type just described, one must assess the realism of the test setup in contrast to the actual field system. If it does not model real life adequately, then some adjustments to the laboratory value must be made. This is often the case. Thus the laboratory-

18

GTC

Table 4.2 Recommended preliminary factor of safety values for determining allowable flow rate or transmissivity of geonets

Application Area	Partial Factor of Safety Value in Equation 4.5			
	FS_{IN}	FS_{CR}*	FS_{CC}	FS_{BC}
Sport fields	1.0 to 1.2	1.0 to 1.5	1.0 to 1.2	1.1 to 1.3
Capillary breaks	1.1 to 1.3	1.0 to 1.2	1.1 to 1.5	1.1 to 1.3
Roof and plaza decks	1.2 to 1.4	1.0 to 1.2	1.0 to 1.2	1.1 to 1.3
Retaining walls, seeping rock and soil slopes	1.3 to 1.5	1.2 to 1.4	1.1 to 1.5	1.0 to 1.5
Drainage blankets	1.3 to 1.5	1.2 to 1.4	1.0 to 1.2	1.0 to 1.2
Surface water drains for landfill caps	1.3 to 1.5	1.2 to 1.4	1.0 to 1.2	1.2 to 1.5
Secondary leachate collection (landfills)	1.5 to 2.0	1.4 to 2.0	1.5 to 2.0	1.5 to 2.0
Primary leachate collection (landfills)	1.5 to 2.0	1.4 to 2.0	1.5 to 2.0	1.5 to 2.0

*These values assume that the q_{ult} value was obtained using an applied normal pressure of 1.5 to 2 times the field-anticipated maximum value. If not, values must be increased.

done at the proper design load and hydraulic gradient and that this testing yielded a short-term between-rigid-plates value of 1.2 gal./min.-ft.

Solution: Since better information is not known, average values from Table 4.2 are used.

$$q_{allow} = q_{ult}\left[\frac{1}{FS_{IN} \times FS_{CR} \times FS_{CC} \times FS_{BC}}\right] \tag{4.5}$$

$$= 1.2\left[\frac{1}{1.1 \times 1.1 \times 1.1 \times 1.2}\right]$$

$$= 1.2\left[\frac{1}{1.60}\right]$$

$$= 0.75 \text{ gal./min.-ft.}$$

Example:

What is the allowable geonet flow rate to be used in the design of a secondary leachate collection system? Assume that laboratory testing at proper design load and proper hydraulic gradient gave a short-term between-rigid-plates value of 1.2 gal./min.-ft.

Solution: Average values from Table 4.2 are used; however, note the large reduction.

CONSOLIDATION ANALYSIS OF SOUTH MESA
BRC CAMU
HENDERSON, NEVADA

OBJECTIVE

The objective of this calculation package is to evaluate the consolidation settlement potential of the south mesa at the BRC Corrective Action Management Unit (CAMU) located in Henderson, Nevada. In particular, the amount of differential settlement and strain will be evaluated.

SUMMARY OF ANALYSIS

The calculations suggest that the strain on the liner system due to differential settlement is within tolerable amounts. In addition, the proposed grading plan will accommodate the calculated differential settlement without significant effects on drainage. Since limited information is available regarding the consolidation characteristics of the soil strata, interpretation was required and the analyses were approached on a conservative basis.

SITE BACKGROUND

Native material within the limits of the BRC CAMU consists of alluvial granular soils overlying fine-grained soils. Shear strength parameters for the native soil material were previously estimated and reported in the *Preliminary Geotechnical and Geologic Investigation - Industrial Non-Hazardous Disposal Facility* (Converse 1999). Twelve exploratory borings were conducted by others to depths ranging from 33-ft to 60-ft (Converse 1999). In general, the native materials appear to be consistent between borings. Six consolidation tests were performed on retrieved samples of sandy clay (CL). All samples were inundated with water at 2000 psf. The author has approximated the saturated consolidation curve for the purposes herein. A summary of the consolidation test results as reported by Converse (1999) are presented in Attachment 1.

ANALYSIS

Terzaghi's one-dimensional consolidation theory will be used to evaluate the consolidation potential of the south mesa at the BRC CAMU. The method of analysis to evaluate the maximum differential settlement is to compare the calculated settlement at each boring location.

Written by: Rebecca Flynn Date: 06 / 08 / 21 (YY MM DD) Reviewed by: BRC Date: 06 / 11 / 13 (YY MM DD)

Client: BRC Project: BRC CAMU Project/Proposal No.: SC0313 Task No.: 01-04

After the expected settlement is known for each location, the maximum differential settlement and strain can be calculated. The location of each boring is presented in Figure 1. An idealized profile for the borings is presented in Figure 2. The sandy clay (CL) layers are highlighted.

The Casagrande construction method was used to evaluate if the lean clay is normally consolidated and to construct the field consolidation curve. The construction is shown in Attachment 1. The following results are obtained:

Sample	Depth (ft)	Initial e_o	C_c	Liquid Limit (%)	Moisture Content (%)	Present Consolidation Pressure (ksf)	Previous Consolidation Pressure (ksf)
B-8	39.0	1.9	0.55		64	3.71	about 3.7
B-8	49.0	1.41	0.98		51	5.18	about 5.0
B-102	49.0	1.52	0.86	88	49	4.89	about 4.1
B-10	54.0	1.76	0.81		68	5.06	about 4.1
B-101	59.0	1.31	0.52		38	4.88	about 4.4
B-101	39.0	1.55	0.47	105	45	3.7	about 4.0
Avg.		1.58	0.73				

Based on the above results, the lean clay deposit can be categorized as normally consolidated (i.e., the previous consolidation pressure is relatively close to the present consolidation pressure).

The settlement calculations are presented in Attachment 2. The results are summarized below:

Boring	Thickness of CL (ft)	Calculated Settlement (ft)
B-10	22 ft (interbedded layers of SM)	2.54
B-12	24 ft	2.58
B-8	22 ft	2.35
B-102	8 ft	0.92
B-5	10 ft	1.18
B-4	5 ft	0.37

As shown in Figure 1, borings B-4, B-5, B-8, B-10, B-12, and B-102 were considered for this analysis. Borings B-101 and B-103 were not considered because they lie well outside the liner

Written by: Rebecca Flynn Date: 06/08/21 (YY/MM/DD) Reviewed by: GTC Date: 06/11/3 (YY/MM/DD)

Client: BRC Project: BRC CAMU Project/Proposal No.: SC0313 Task No.: 01-04

limits. Settlement was calculated at the aforementioned boring locations (known CL thickness). However, consolidation tests were not necessarily performed at each of these locations. For locations were there was no consolidation data, the average values for e_o and C_c were used. See Attachment 2 for settlement calculations.

The shortest distance between borings and the largest differential settlement will result in the largest strain. This relationship is defined as:

$$\varepsilon = \Delta h/L$$

The maximum differential settlement at the shortest distance was between borings B-4, and boring B-8 (see Figure 1). The distance between the borings is 470 ft. The strain is:

$$\varepsilon = \Delta h/L = (2.35\text{-}0.37)/470 = 0.42 \text{ percent.}$$

Assuming a linear differential settlement profile, the calculated strain is well below the typical yield strength of HDPE geomembrane. Typical strain at the yield stress for HDPE geomembrane is approximately 12 percent (Koerner 1994).

CONCLUSIONS

Based on available information and the author's interpretation of the appropriate consolidation curves, the following can be concluded:

- The CL deposit can be characterized as normally consolidated;
- The maximum settlement expected in the south mesa is approximately 2 ft;
- The maximum strain expected in the south mesa is approximately 0.4%
- The liner system and proposed grading can accommodate the expected differential settlement and strain.

CONSOLIDATION ANALYSES OF SLIT TRENCHES
BRC CAMU
HENDERSON, NEVADA

OBJECTIVE

The objective of this calculation package is to evaluate the consolidation settlement potential of landfilled waste in the "slit trenches" of the North Mesa at the BRC Corrective Action Management Unit (CAMU) located in Henderson, Nevada. In particular, the amount of differential settlement and potential strain in an overlying geosynthetic liner will be evaluated. Finally, the height of surcharge material to be used in pre-loading the slit-trenches will be calculated.

SUMMARY OF ANALYSES

Since limited information is available regarding the consolidation characteristics of the soil strata, interpretation was required and the analyses were approached on a conservative basis. Should the liner system be constructed overlying the existing, unconsolidated "slit trenches", the calculations suggest that the strain on the liner system due to differential settlement is not within tolerable amounts. The strain on the liner system may be reduced to within tolerable amounts if the trenches are first 'pre-loaded' with approximately 40 feet of surcharge material.

SITE BACKGROUND

Native material within the limits of the BRC CAMU consists of alluvial granular soils overlying fine-grained soils. Shear strength parameters for the native soil material were previously estimated and reported in the *Preliminary Geotechnical and Geologic Investigation - Industrial Non-Hazardous Disposal Facility* (Converse 1999). Twelve exloratorary borings were conducted by others to depths ranging from 33-ft to 60-ft (Converse 1999). In general, the native materials appear to be consistent between borings.

In January 2005, BRC performed a subsurface investigation of the slit trenches, consisting of continuous, split-spoon sampling to determine the depth of landfilled waste. Twenty exploratory borings were advanced to depths ranging from 22-ft to 32-ft (Attachment A). The thickness of landfilled waste ranges between 5-ft to 26-ft, and consists of typical industrial waste and

Written by: Rebeccca Flynn Date: 06/08/22 (YY MM DD) Reviewed by: ETC Date: 06/11/3 (YY MM DD)

Client: BRC Project: BRC CAMU Project/Proposal No.: SC0313 Task No.: 01-04

construction/demolition debris: wood, paper, fabric, plastic, glass, and metal. The width of slit trenches ranges between 20 feet and 76 feet

The design of the proposed North Mesa landfill includes approximately 38-ft of waste and 2-ft of cover soil, resulting in approximately 40-ft of overburden material on the present base grades.

ANALYSIS

Consolidation Settlement

Terzaghi's one-dimensional consolidation theory will be used to evaluate the consolidation potential of the slit trenches of the North Mesa at the BRC CAMU. The method of analysis to evaluate the maximum differential settlement is to compare the calculated settlement at each boring location. After the expected settlement is known for each location, the maximum differential settlement and strain can be calculated.

There are two components to the total settlement calculated by one-dimensional consolidation theory, primary settlement and secondary settlement. The calculation of total consolidation settlement is governed by the following equation:

$$S_T = S_P + S_S$$

Where:

S_p = magnitude of primary consolidation settlement, ft
S_S = magnitude of secondary consolidation settlement, ft

The calculation of primary settlement is governed by the following equation:

$$S_p = C'_c \cdot H \cdot \log\left(\frac{p_o + \Delta p}{p_o}\right)$$ (Attachment B, 1 of 2)

Where:

S_p = magnitude of primary consolidation settlement, ft
C'_c = compression index for the compressible layer (waste) = 0.3
H = initial thickness of compressible layer (waste), ft
p_o = initial overburden pressure on the compressible layer, lb/ft^2
Δp = change in overburden pressure due to loading, lb/ft^2

Written by: Rebeccca Flynn Date: 06/08/22 (YY/MM/DD) Reviewed by: ETC Date: 06/11/3 (YY/MM/DD)

Client: BRC Project: BRC CAMU Project/Proposal No.: SC0313 Task No.: 01-04

Furthermore:

$$p_o = \frac{H}{2} \cdot \gamma_{waste} + H_{soil,overburden} \cdot \gamma_{soil,overburden}$$

H = initial thickness of compressible layer, ft
γ_{waste} = unit weight of waste = 85 lb/ft^3
$H_{soil,overburden}$ = thickness of soil overburden over waste, ft
$\gamma_{soil,overburden}$ = unit weight of soil overburden = 115 lb/ft^3

and $$\Delta p = H_{soil,waste} \cdot \gamma_{soil,waste} + H_{soil,coversystem} \cdot \gamma_{soil,coversystem}$$

$H_{soil,waste}$= thickness of waste to be placed in landfill, ft
γ_{waste} = unit weight of waste to be placed in landfill = 136 lb/ft^3
$H_{soil,coversystem}$ = thickness of soil in landfill cover system, ft
$\gamma_{soil,coversystem}$= unit weight of soil in landfill cover system = 125 lb/ft^3

The calculation of secondary settlement is governed by the following equation:

$$S_S = C'_\alpha \cdot H \cdot \log\left(\frac{t_2}{t_1}\right)$$ (Attachment B, 2 of 2)

Where:

S_S = magnitude of secondary consolidation settlement, ft
C'_α = secondary compression index for the compressible layer (waste) = 0.019
H = initial thickness of compressible layer (waste), ft
t_1 = time at beginning of secondary consolidation = 26 year (assuming waste placement ended in 1980)
t_2 = time at end of consolidation, years = 59 years (t_1 + 30 years post-closure maintenance + 3 years of landfill operation)

The compression index (C_c) and secondary compression index (C'_α) are normally determined through laboratory analyses of samples collected during subsurface investigation. In the absence of such testing, the following calculations use a conservatively high C_c value, as obtained from Deutsch, et al. (Attachment C), and a conservatively high C'_α value, as obtained from Bjarngard, et al. (Attachment D).

Strain Due to Differential Settlement

The differential settlement between the compressible material in a slit trench and the relatively incompressible native material adjacent to the trench will result in strain in the overlying liner system. The maximum strain is assumed to occur at the middle of the trench, at the point of maximum settlement. This relationship is defined as:

$$\varepsilon = \frac{\sqrt{S_T^{\,2} + L^2}}{L} - 1$$

Written by: Rebeccca Flynn Date: 06/08/22 (YY/MM/DD) Reviewed by: CTC Date: 06/11/3 (YY/MM/DD)

Client: BRC Project: BRC CAMU Project/Proposal No.: SC0313 Task No.: 01-04

Where:

ε = strain in liner system due to differential settlement
L = half the width of the slit trench, ft
S_T = total settlement, ft

The maximum allowable strain in the liner system is selected to be 1% to maintain drainage of the leachate collection system (3%, as constructed) and acceptable for the geomembrane material properties. Those locations that exceed the allowable strain will require "pre-loading" prior to liner placement. The purpose of this "pre-loading" is to achieve consolidation settlement of the waste and minimize settlement induced strain. The required settlement to be achieved by pre-loading is calculated as follows:

$$S_{req} = S_T - (\varepsilon_{allow} \cdot L)$$

Where:

S_{req} = required settlement, ft
S_T = total settlement, ft
ε_{allow} = maximum allowable strain in liner system = 1%
L = half the width of the slit trench, ft

Written by: Rebeccca Flynn Date: 06/08/22 (YY/MM/DD) Reviewed by: DTC Date: 06/11/3 (YY/MM/DD)

Client: BRC Project: BRC CAMU Project/Proposal No.: SC0313 Task No.: 01-04

The strain calculations are presented in Attachment E (2 of 3). The results are summarized below:

Location	L (ft)	Strain, ε	S_{req} (ft)
BS-01	20	0.02%	-
BS-02	20	0.15%	-
BS-03	20	1.55%	2.52
BS-04	10	1.72%	0.85
BS-05	10	6.91%	2.77

BS-19	13	0.54%	-
BS-20	13	0.20%	-

Required Surcharge Height

The surcharge height necessary to preload the slit trenches and obtain the required settlement is calculated by rearranging the equation for primary consolidation settlement (S_P), as below:

$$H_{surch\,arg\,e} = \frac{\left(10^{\left(\frac{S_{req}}{C_c \cdot H}\right)} \cdot p_o\right) - p_o}{\gamma_{surch\,arg\,e}}$$

Written by: Rebeccca Flynn Date: 06/08/22 (YY/MM/DD) Reviewed by: [illegible] Date: 06/11/3 (YY/MM/DD)

Client: BRC Project: BRC CAMU Project/Proposal No.: SC0313 Task No.: 01-04

Where:

$H_{surcharge}$ = height of surcharge, ft
S_{req} = required settlement, ft
C_c = compression index for the compressible layer (waste) = 0.3
H = initial thickness of compressible layer (waste), ft
p_o = initial overburden pressure on the compressible layer, lb/ft^2
$\gamma_{surcharge}$ = unit weight of surcharge soil = 135 lb/ft^3

The surcharge height calculations are presented in Attachment E (3 of 3). The results are summarized below:

Location	S_{req} (ft)	$H_{surcharge}$ (ft)
BS-01	-	-
BS-02	-	-
BS-03	2.52	23
BS-04	0.85	12
BS-05	2.77	22
BS-06	3.45	24
BS-07	2.53	23
BS-08	0.73	12
BS-09	2.81	24
BS-10	-	-
BS-11	-	-
BS-12	4.41	29
BS-13	3.54	26
BS-14	3.99	28
BS-15	-	-
BS-16	-	-
BS-17	-	-
BS-18	-	-
BS-19	-	-
BS-20	-	-

Thus, it appears that a maximum of 29 feet of surcharge should be placed overlying the slit trenches to minimize the effects of settlement induced strain in the base liner system.

Client: BRC Project: BRC CAMU Project/Proposal No.: SC0313 Task No.: 01-04

CONCLUSIONS

Based on available information and the results of these consolidation analyses, the following can be concluded:

- The maximum differential settlement expected in the slit trenches of the North Mesa is approximately 4.96 ft;
- The height of surcharge required to pre-load the North Mesa is a maximum of 29 ft;
- The maximum strain expected in the slit trenches of the North Mesa, AFTER PRELOADING, is approximately 1% ; and
- The liner system and proposed grading can accommodate the expected differential settlement and strain.

where e_o = initial void ratio at volume V_o. Thus, from Eqs. (8.11) through (8.14),

$$\Delta V = SA = \Delta e V_s = \frac{AH}{1 + e_o} \Delta e$$

or

$$S = H \frac{\Delta e}{1 + e_o} \tag{8.15}$$

For normally consolidated clays that exhibit a linear e–log p relationship (see Figure 8.9),

$$\Delta e = C_c[\log (p_o + \Delta p) - \log p_o] \tag{8.16}$$

where C_c = slope of the e–log p plot and is defined as the compression index. Substitution of Eq. (8.16) into Eq. (8.15) gives

$$\boxed{S = \frac{C_c H}{1 + e_o} \log \left(\frac{p_o + \Delta p}{p_o} \right)} \tag{8.17}$$

For a thicker clay layer, it is more accurate if the layer is divided into a number of sublayers and calculations for settlement are made separately for each sublayer. Thus, the total settlement for the entire layer can be given as

$$S = \sum \left[\frac{C_c H_i}{1 + e_o} \log \left(\frac{p_{oi} + \Delta p_{oi}}{p_{oi}} \right) \right]$$

where H_i = thickness of sublayer i
p_{oi} = initial average effective overburden pressure for sublayer i
Δp_{oi} = increase of vertical pressure for sublayer i

In overconsolidated clays (see Figure 8.10), for $p_o + \Delta p \le p_c$, field e–log p variation will be along the line hj, the slope of which will be approximately equal to that for the laboratory rebound curve. The slope of the rebound curve, C_s, is referred to as the *swell index*, so

$$\Delta e = C_s[\log (p_o + \Delta p) - \log p_o] \tag{8.18}$$

From Eqs. (8.15) and (8.18),

$$\boxed{S = \frac{C_s H}{1 + e_o} \log \left(\frac{p_o + \Delta p}{p_o} \right)} \tag{8.19}$$

If $p_o + \Delta p > p_c$, then

$$\boxed{S = \frac{C_s H}{1 + e_o} \log \frac{p_c}{p_o} + \frac{C_c H}{1 + e_o} \log \left(\frac{p_o + \Delta p}{p_c} \right)} \tag{8.20}$$

The magnitude of the secondary consolidation can be calculated as

$$S_s = C'_\alpha H \log\left(\frac{t_2}{t_1}\right) \tag{8.27}$$

where

$$C'_\alpha = \frac{C_\alpha}{1 + e_p} \tag{8.28}$$

e_p = void ratio at the end of primary consolidation (see Figure 8.18)
H = thickness of clay layer

The general magnitudes of C'_α as observed in various natural deposits are given in Figure 8.19.

Secondary consolidation settlement is more important than primary consolidation in organic and highly compressible inorganic soils. In overconsolidated inorganic clays, the secondary compression index is very small and of less practical significance.

Several factors might affect the magnitude of secondary consolidation, some of which are not clearly understood (Mesri, 1973). The ratio of secondary to primary compression for a given thickness of soil layer depends on the ratio of the stress increment (Δp) to the initial effective stress (p). For small $\Delta p/p$ ratios, the secondary-to-primary compression ratio is larger.

EXAMPLE 8.4

For a normally consolidated clay layer in the field, the following are given:

- thickness of clay layer = 8.5 ft
- Void ratio (e_O) = 0.8
- Compression index (C_c) = 0.28
- Average effective pressure on the clay layer (p_O) = 2650 lb/ft^2
- Δp = 970 lb/ft^2
- Secondary compression index (C_α) = 0.02

What is the total settlement of the clay layer five years after the completion of primary consolidation settlement? (*Note:* Time for completion of primary settlement = 1.5 years.)

Solution From Eq. (8.28),

$$C'_\alpha = \frac{C_\alpha}{1 + e_p}$$

INTRODUCTION

The large-scale field study discussed in this paper was completed for the purpose of determining design parameters for potential overfilling of existing landfill sideslopes at the Lanchester Landfill facility in Honey Brook, Pennsylvania. In particular, to maximize future waste disposal quantities at this facility, the Chester County Solid Waste Authority (CCSWA) is proposing to overfill additional municipal solid waste (MSW) within the available air space between the eastern sideslope of their closed Municipal Site Landfill and the adjacent western sideslope of Cell No. 1 of their currently active Area B landfill. In accordance with current Pennsylvania Department of Environmental Resources (DER) MSW landfill lining system regulations, CCSWA must initially install a geosynthetic lining/leachate collection system over the existing landfill sideslope prior to placement of additional waste at this location. The intent of this project was to simulate the total settlements and lateral movements of the existing waste mass when subjected to the additional applied stress of overfilled waste materials. These vertical and lateral movements would allow the maximum strains that these movements would generate within the geosynthetics of an overfill lining system to be calculated. Based on these calculated strains, appropriate geosynthetic reinforcement criteria for the overfill lining system could be developed. The reinforcement would protect the geosynthetic components of this lining system, in particular, the geomembrane, from excessive straining and possible tear resulting from underlying waste settlements.

To complete this study, an earthen surcharge pile, whose maximum height modeled the stress of the proposed overfilled waste, was constructed on the eastern sideslope of the closed Municipal Site Landfill following an initial survey of the topography of this slope.

Attachment C 1/2

GTC 6/9/05

Tabulated values of the independent variables are presented in Table 2 for each of the 64 nodal point locations. These values were subsequently input into Equation 2 in order to calculate the "modified compressibility index" (C′) of the waste. These values are also presented in Table 2 for each of the 64 nodal points.

It is evident from an inspection of Table 2 that the calculated values of C′ define a fairly limited range of values. with the exception of nodal points H1 through H8. In particular, the C′ values for the 56-nodal point database consisting of lines A through G varied from 0.15 to 0.39, averaging 0.22,, while the C′ database consisting of H line values varied from 0.66 to 0.98, averaging 0.80. It is clear that the H line values are anomalous. This is believed to be due to the minimal and highly variable surcharge pile thicknesses that existed in the vicinity of the nodal points along the H line resulting from the sloping geometry of the back face of the pile at these locations. As a result, the surcharge loading varies considerably in the vicinity of each H line nodal point location. Therefore, there is significant error in assuming that the load at these nodal point locations can be accurately calculated using Equation 4. Based on the above discussion, it was believed appropriate to disregard the H line C′ values in generating pertinent statistics for this database as discussed in the following paragraph.

The 56-point database was analyzed statistically. A quantitative procedure was used to confirm that the database is normally distributed. The mean ($\bar{x}$), standard deviation (σ), variance (σ^2), and coefficient of variation (C_v) of the database were also calculated. These values are as follows:

$\bar{x} = 0.22$ $\quad\quad$ $\sigma^2 = 0.0016$

$\sigma = 0.0402$ $\quad\quad$ $C_v = 10.27\%$

.0402

Based on the properties of a normal distribution, it is known that 97.5% of the database lies below the random variable value of $\bar{x} + 2\sigma$. For this database, this value is equal to 0.22 + 2(0.402) = 0.30. Therefore, it can be concluded that calculation of surcharge load induced MSW settlement using Equation 1 with known values of H_w, $\bar{\sigma}_{o_w}$, and $\Delta\sigma_s$ will yield a conservative estimate of this settlement 97.5% of the time if a value of

$$C' = \frac{C_c}{1 + e_o} = 0.30$$

is used in the equation.

no initials

II. Analysis Using a Multiple Linear Regression Model

The 56-point database was also analyzed using a multiple linear regression model, in which the dependent variable waste settlement (ΔH_w) was assumed to be a linear function of the independent variables waste thickness (H_w) and applied surcharge loading ($\Delta\sigma_s$). The form of this equation is as follows:

SETTLEMENT OF MUNICIPAL SOLID WASTE LANDFILLS

by Anders Bjarngard[1] and Lewis Edgers[2]

Abstract

Landfill settlement data from 24 case histories were collected and analyzed to establish engineering parameters for the prediction of landfill settlement. Several one-dimensional laboratory compression tests were performed to evaluate the load and time dependent compression characteristics of paper. Standard geotechnical engineering parameters were used to describe settlements.

Both the field and laboratory data show large initial settlements, followed by high logarithmic rates of delayed compression. Primary consolidation was generally not observed in the field or laboratory data. The field data suggest two phases of delayed compression, one dominated by mechanical compression and a later phase possibly showing the added effects of decomposition. The delayed (secondary) compression coefficient (C_α) ranged from 0.01 to 0.056 for the laboratory data and from 0.003 to 0.038 for the first phase of the field data. The second phase, at long time periods, showed field values of C_α as large as 0.51.

Introduction

The settlement of landfills is important in a number of ways. Settlement will affect the:

- design of protection systems such as caps, leachate collection and drainage systems.

1. Initial settlements from the first load increment.
2. Initial settlements excluding first load increment.

Conclusions

Settlement of MSW landfills can be large and continue for very long time periods. This settlement is believed to occur due to mechanical compression, ravelling of particles and decomposition of the waste. This paper has reviewed available MSW landfill settlement data, compared these data with the results of one-dimensional laboratory tests on paper specimens, and quantified the measured compressions.

Review of settlement data from MSW landfills has shown little settlement due to primary consolidation. On the other hand, the long-term settlements due to mechanical effects (secondary compression), possible ravelling, piping or collapse, and possible chemical and biological decomposition develop over a long period of time and may become large. They are very difficult to predict because they are highly dependent upon site-specific factors such as moisture, density and composition which are usually not well defined.

The complex time-settlement behavior of landfills has been idealized by separating it into three phases: initial compression; early delayed compression; and late delayed compression. In the first phase, settlements are believed to occur because of rapid compression of the refuse and reduction of the gas voids. In the second phase, settlements are believed to be caused mostly by long-term reorientation, slippage at the particle contacts, and delayed compression of some of the MSW constituents. It is believed that in the third phase, the rate of delayed compression is greatly increased by decomposition. Ravelling may also be a contributing factor to the delayed compression phases.

The following measures of landfill settlement were observed from the case histories:

1. INTRODUCTION

1.1 Terms of Reference

GeoSyntec Consultants (GeoSyntec) has prepared this Construction Quality Assurance (CQA) Plan for the construction of the Corrective Action Management Unit (CAMU) Base Liner System for Basic Remediation Company (BRC) located in Henderson, Nevada. Hereinafter, the CAMU construction is referred to as the Project.

This CQA Plan was prepared by Mr. Gregory T. Corcoran, P.E. of GeoSyntec Consultants (GeoSyntec) under the direction of Mr. James A. McKelvey III, P.E. In general accordance with the peer review policies of the firm, Mr. James A. McKelvey III, P.E. of GeoSyntec was responsible for senior peer review of the work presented in this plan.

1.2 Purpose and Scope of the Construction Quality Assurance Plan

The purpose of the CQA Plan is to address the CQA procedures and monitoring requirements for construction of the Project. The CQA Plan is intended to: (i) define the responsibilities of parties involved with the construction; (ii) provide guidance in the proper construction of the major components of the Project; (iii) establish testing protocols; (iv) establish guidelines for construction documentation; and (v) provide the means for assuring that the Project is constructed in conformance to the *Technical Specifications*, permit conditions, applicable regulatory requirements, and *Construction Drawings*.

This CQA Plan addresses the soils and geosynthetic components of the liner system for the project. The soils, geosynthetic, and appurtenant components include engineered fill, prepared subgrade, operations layer material, drainage aggregate, geosynthetic clay liner, geomembrane, geotextile, geocomposite, and polyethylene pipe. It should be emphasized that care and documentation are required in the placement and compaction of the soils and aggregate and in the production and installation of the geosynthetic materials placed during construction. The CQA Plan, therefore, delineates the procedures to be followed for monitoring construction of these materials.

The scope of this CQA Plan includes the CQA of the soil and geosynthetic components of the Project. The CQA monitoring activities during the selection,

evaluation, treatment, placement, and compaction of soils for earthworks, and drainage aggregate are included in the scope of this plan. The CQA protocols applicable to manufacturing, shipping, handling, and installing all geosynthetic materials are also included. However, this CQA Plan does not specifically address either installation specifications or specification of soils and geosynthetic materials as these requirements are addressed in the *Technical Specifications*.

1.3 References

The CQA Plan includes references to test procedures in the latest editions of the American Society for Testing and Materials (ASTM).

1.4 Organization of the Construction Quality Assurance Plan

The remainder of the CQA Plan is organized as follows:

- Section 2 presents definitions relating to CQA;
- Section 3 describes the parties involved with the CQA;
- Section 4 describes the responsibilities of the CQA personnel;
- Section 5 describes site and project control requirements;
- Section 6 presents CQA documentation;
- Section 7 presents CQA of earthworks;
- Section 8 presents CQA of the drainage aggregates;
- Section 9 presents CQA of the pipe and fittings;
- Section 10 presents CQA of the geomembrane;
- Section 11 presents CQA of the geotextile;
- Section 12 presents CQA of the geosynthetic clay liner;
- Section 13 presents CQA of the geocomposite; and
- Section 16 presents CQA surveying.

2. DEFINITIONS RELATING TO CONSTRUCTION QUALITY ASSURANCE

This CQA Plan is devoted to Construction Quality Assurance. In the context of this document, Construction Quality Assurance and Construction Quality Control are defined as follows:

Construction Quality Assurance (CQA) - A planned and systematic pattern of means and actions designed to assure adequate confidence that materials and/or services meet contractual and regulatory requirements and will perform satisfactorily in service.

Construction Quality Control (CQC) - Those actions which provide a means to measure and regulate the characteristics of an item or service in relation to contractual and regulatory requirements.

In the context of this document:

- CQA refers to means and actions employed by the CQA Consultant to assure conformity of the Project "Work" with this CQA Plan, the *Drawings*, and the *Technical Specifications*.

- Construction Quality Control refers to those actions taken by the Contractor, Manufacturer, or Geosynthetic Installer to verify that the materials and the workmanship meet the requirements of this CQA Plan, the *Drawings*, and the *Technical Specifications*. In the case of soil components, CQC is combined with CQA and is provided by the CQA Consultant. In the case of the geosynthetic components and piping of the Work, CQC is provided by the Manufacturer and Geosynthetic Installer and the Contractor. CQA testing of soil, pipe, and geosynthetic components is provided by the CQA Consultant.

3. PARTIES INVOLVED WITH CONSTRUCTION QUALITY ASSURANCE

3.1 Engineer

Responsibilities

The Engineer is responsible for the design, *Drawings*, and *Technical Specifications* for the Project Work. In this CQA Plan, the term "Engineer" refers to Parsons Engineering Science, Inc. (Parsons) and GeoSyntec.

Qualifications

The Engineer of Record shall be a qualified engineer, registered as required by Nevada state regulations. The Engineer should have expertise, which demonstrates significant familiarity with piping, geosynthetics and soils, as appropriate, including design and construction experience related to landfill liner systems.

3.2 Project Manager

Responsibilities

The Project Manager is responsible for implementing the design, and overseeing subcontractors. In this CQA Plan, the term "Project Manager" refers to a qualified BRC employee.

Qualifications

The Project Manager shall be a qualified engineer having familiarity with earthwork construction and installation of geosynthetic materials.

3.3 Contractor

Responsibilities

In this CQA Plan, Contractor refers to an independent party or parties, contracted by the Owner, performing the Work in general accordance with this CQA

Plan, the *Drawings*, and the *Technical Specifications*. The Contractor will be responsible for the installation of the soils and geosynthetic components of the liner system. This work will include excavation, placement and compaction of engineered fill and prepared subgrade, placement of drainage aggregate and native soil (operations layer material), installation and of piping and concrete manhole, installation of temporary erosion control features, and coordination of work with the Geosynthetic Installer and other subcontractors.

The Contractor will be responsible for constructing the liner system and appurtenant components in general accordance with the *Drawings* and complying with the quality control requirements specified in the *Technical Specifications*.

Qualifications

Qualifications of the Contractor are specific to the construction contract. The Contractor should have a demonstrated history of successful earthworks construction and maintain current state and federal licenses as appropriate.

3.4 Resin Supplier

Responsibilities

The Resin Supplier produces and delivers the resin to the Geosynthetics Manufacturer.

Qualifications

Qualifications of the Resin Supplier are specific to the Manufacturer's requirements. The Resin Supplier will have a demonstrated history of providing resin with consistent properties.

3.5 Geosynthetics Manufacturer

Responsibilities

The Manufacturer is responsible for the production of finished material (geomembrane, geotextile, geosynthetic clay liner, geocomposite, pipe, and other specified material) from appropriate raw materials.

Qualifications

The Manufacturer(s) will be able to provide sufficient production capacity and qualified personnel to meet the demands of the project. The Manufacturer(s) must be a well established firm(s) that meet the requirements identified in the *Technical Specifications*.

3.6 Geosynthetic Installer

Responsibilities

The Geosynthetic Installer is responsible for field handling, storage, placement, seaming, loading or anchoring against wind uplift, and other aspects of the geosynthetic material installation. The Geosynthetic Installer may also be responsible for specialized construction tasks (i.e., including construction of anchor trenches for the geosynthetic materials).

Qualifications

The Geosynthetic Installer will be trained and qualified to install the geosynthetic materials of the type specified for this project. The Geosynthetic Installer shall meet the qualification requirements identified in the *Technical Specifications*.

3.7 CQA Consultant

Responsibilities

The CQA Consultant is a party, independent from the Contractor, Manufacturer, and Geosynthetic Installer, who is responsible for observing, testing, and documenting activities related to the CQC and CQA of the earthwork, piping, and the geosynthetic components used in the construction of the Project. The CQA Consultant will also be responsible for issuing a CQA report at the completion of the Project construction, which details the earthworks, piping, and geosynthetic installation activities and associated CQA activities. The CQA report will be signed and sealed by the CQA Officer who will be a Professional Engineer registered in the State of Nevada.

The CQA Consultant will be responsible for obtaining and testing representative samples of all components used in construction of the Project as required by this CQA Plan and *Technical Specifications*. All tests will be conducted in general accordance with ASTM or other applicable state or federal standards. Test results must be submitted to the Project Manager within a reasonable timeframe, which will not impede or delay construction of the Project. The CQA Consultant will be responsible for inspecting all earthwork, piping, and geosynthetic operations to verify that the components are installed in general accordance with this CQA Plan and *Technical Specifications*.

Qualifications

The CQA Consultant is a well established firm specializing in geotechnical and geosynthetic engineering and possess the equipment, personnel, and licenses necessary to conduct the geotechnical and geosynthetic tests required by the project plans and *Technical Specifications*. The CQA Consultant will provide qualified staff for the project, as necessary, which will include, at a minimum, a CQA Officer, and a CQA Site Manager. The CQA Officer will be a professionally licensed engineer as required by Nevada State regulations.

The CQA Consultant will be experienced with earthwork construction and the installation of geosynthetic materials similar to those materials used in construction of the Project. The CQA Consultant will be experienced in the preparation of CQA documentation including CQA Plans, field documentation, field testing procedures,

laboratory testing procedures, construction specifications, construction drawings, and CQA reports.

The CQA Site Manager will be specifically familiar with the construction of earthworks, piping, and the installation of geosynthetic materials and will be trained by the CQA Consultant in the duties of a CQA Site Manager.

3.8 Surveyor

Responsibilities

The Surveyor is a party, independent from the Contractor, Manufacturer, and Geosynthetic Installer, that is responsible for surveying, documenting, and verifying the location of all significant components of the Work. The Surveyor's work is coordinated and employed by the Owner. The Surveyor is responsible for issuing record drawings of the construction.

Qualifications

The Surveyor will be a well established surveying company with at least 3 years experience in the profession of surveying services in the State of Nevada. The Surveyor will be a licensed professional as required by the State of Nevada regulations. The Surveyor shall be fully equipped and experienced in the use of total stations and AutoCAD Version 14. All surveying will be performed under the direct supervision of the Owner.

3.9 CQA Laboratory

Responsibilities

The CQA Laboratory is a party, independent from the Contractor, Manufacturer and Geosynthetic Installer, that is responsible for conducting tests in general accordance with ASTM and other applicable test standards on samples of geosynthetic materials, soil, and in the field and in either an on-site or off-site laboratory.

Qualifications

The CQA Laboratory will have experience in testing soils and geosynthetic materials and will be familiar with ASTM and other applicable test standards. The CQA Laboratory will be capable of providing test results within a maximum of seven days of receipt of samples and will maintain that capability throughout the duration of earthworks construction and geosynthetic materials installation. The CQA Laboratory will also be capable of transmitting geosynthetic destructive test results within 24 hours of receipt of samples and will maintain that capability throughout the duration of geosynthetic material installation.

4. CQA CONSULTANTS PERSONNEL ORGANIZATION AND DUTIES

4.1 Overview

The CQA Officer will provide supervision within the scope of work of the CQA Consultant. The scope of work for the CQA Consultant includes monitoring of construction activities including the following:

- excavation and screening of materials;
- placement and compaction of engineered fill, surcharge prepared subgrade, and operations layer material;
- installation of geotextile;
- installation of geosynthetic clay liner;
- installation of geomembrane;
- installation of drainage aggregate;
- installation of geocomposite;
- installation of cast-in-place concrete; and
- installation of piping.

The duties of the CQA personnel are discussed in the remainder of this section.

4.2 CQA Personnel

For construction of the Project, the CQA Consultant's personnel will include:

- the CQA Officer, who operates from the office of the CQA Consultant and who conducts periodic visits to the site as required; and

- the CQA Site Manager, who is located at the site.

The duties of the CQA Personnel are discussed in the following subsections.

4.2.1 CQA Officer

The CQA Officer shall supervise and be responsible for monitoring and CQA activities relating to the construction of the earthworks, piping, and installation of the geosynthetic materials of the Project. Specifically, the CQA Officer:

- reviews the project design, this CQA Plan, *Drawings*, and *Technical Specifications*;

- reviews other site-specific documentation; unless otherwise agreed, such reviews are for familiarization and for evaluation of constructability only, and hence the CQA Officer and the CQA Consultant assume no responsibility for the liner system design;

- reviews and approves the Geosynthetic Installer's QC Plan;

- attends resolution and/or pre-construction meetings as needed;

- administers the CQA program (i.e., provides supervision of and manages on-site CQA personnel, reviews field reports, and provides engineering review of CQA related activities);

- provides quality control of CQA documentation and conducts site visits;

- reviews the record drawings; and

- with the CQA Site Manager, prepares the CQA report documenting that the project was constructed in general accordance with the Construction Documents.

4.2.2 CQA Site Manager

The CQA Site Manager:

- acts as the on-site representative of the CQA Consultant;

- attends CQA-related meetings (e.g., resolution, pre-construction, daily, weekly (or designates a representative to attend the meeting));

- prepares or oversees the ongoing preparation of the record drawings;

- reviews test results provided by Contractor;

- assigns locations for testing and sampling;

- oversees the collection and shipping of laboratory test samples;

- reviews results of laboratory testing and makes appropriate recommendations;

- reviews the calibration and condition of on-site CQA equipment;

- prepares a daily summary report for the project;

- reviews the Manufacturer's QC documentation;

- reviews the Geosynthetic Installer's personnel Qualifications for conformance with those pre-approved for work on site;

- notes in the daily summary report and reports to the CQA Officer and Project Manager on-site activities that could result in damage to the geosynthetic materials or other completed work;

- reports unresolved deviations from the CQA Plan, *Drawings*, and *Technical Specifications* to the Project Manager; and

- assists with the preparation of the CQA report.

5. SITE AND PROJECT CONTROL

5.1 Project Coordination Meetings

Meetings of key project personnel are necessary to assure a high degree of quality during installation, and promote clear, open channels of communication. Therefore, Project Coordination Meetings are an essential element in the success of the project. Several types of Project Coordination Meetings are described below, including: (i) resolution meetings; (ii) pre-construction meetings; (iii) progress meetings; and (iv) problem or work deficiency meetings.

5.1.1 Resolution Meeting

Following the completion of the design, *Drawings*, and *Technical Specifications* for the project and prior to the start of construction, a Resolution Meeting will be held. This meeting may include the CQA Officer, the CQA Site Manager, the Engineer, and the Project Manager.

The purpose of this meeting is to begin planning for coordination of construction tasks, anticipate installation problems which might cause difficulties and delays in construction, and, above all, present the CQA Plan to the parties involved. It is very important that the criteria regarding testing, repair, and other CQA activities be known and accepted by the parties involved in the work prior to the installation of geosynthetic materials and construction of the soil components for the Project.

The first part of the Resolution Meeting may be devoted to a review of the *Drawings* and *Technical Specifications* for familiarity. This is different from the peer review of the design, including design calculations, which will have been carried out previously.

The Resolution Meeting may include the following activities:

- distribute relevant documents to all parties;
- review critical design details of the project;

- review this CQA Plan;
- review the Drawings and Technical Specifications;
- make appropriate modifications to the design criteria, *Drawings*, and *Technical Specifications* so that the fulfillment of the design specifications or performance standards can be determined through the implementation of the CQA Plan;
- reach a consensus on the quality control procedures, especially on methods of evaluating acceptability of the soils and geosynthetic materials;
- assign the responsibilities of each party;
- establish work area security and health and safety protocol;
- confirm the methods for documenting observations, reporting, and distributing documents and reports; and
- confirm the lines of authority and communication.

The Project Manager will appoint one of the meeting attendees to record the discussions and decisions of the Resolution Meeting. The record of the meeting will be documented by the appointee in the form of meeting minutes, which will be subsequently distributed to all attendees.

5.1.2 Pre-Construction Meeting

A Pre-Construction Meeting will be held at the site prior to construction of the Project. As a minimum, the Pre-Construction Meeting will be attended by the Contractor, the Geosynthetic Installer's Superintendent, the CQA Consultant, the Engineer, and the Project Manager.

Specific items for discussion at the pre-construction meeting include the following:

- appropriate modifications or clarifications to the CQA Plan;
- the Drawings and Technical Specifications;
- the responsibilities of each party;
- lines of authority and communication;
- methods for documenting and reporting, and for distributing documents and reports;
- acceptance and rejection criteria;
- protocols for testing;
- protocols for handling deficiencies, repairs, and re-testing;
- the time schedule for all operations;
- procedures for packaging and storing archive samples;
- panel layout and numbering systems for panels and seams;
- seaming procedures;
- repair procedures; and
- soil stockpiling locations.

The Project Manager will conduct a site tour to observe the current site conditions and to review construction material and equipment storage locations. A person in attendance at the meeting will be appointed by the Project Manager to record the discussions and decisions of the meeting in the form of meeting minutes. Copies of the meeting minutes will be distributed to all attendees.

5.1.3 Progress Meetings

Progress meetings will be held between the CQA Site Manager, the Contractor, Project Manager, and other concerned parties participating in the construction of the project. This meeting will include discussions on the current progress of the project, planned activities for the next week, and revisions to the work plan and/or schedule. The meeting will be documented in meeting minutes prepared by a person designated by the CQA Site Manager at the beginning of the meeting. Within 2 working days of the meeting, draft minutes will be transmitted to representatives of parties in attendance for review and comment. Corrections and/or comments to the draft minutes shall be made within 2 working days of receipt of the draft minutes to be incorporated in the final meeting minutes.

5.1.4 Problem or Work Deficiency Meeting

A special meeting will be held when and if a problem or deficiency is present or likely to occur. The meeting will be attended by the Contractor, the Project Manager, the CQA Site Manager, and other parties as appropriate. If the problem requires a design modification, the Engineer should either be present at, consulted prior to, or notified immediately upon conclusion of this meeting. The purpose of the work deficiency meeting is to define and resolve the problem or work deficiency as follows:

- define and discuss the problem or deficiency;
- review alternative solutions;
- select a suitable solution agreeable to all parties; and
- implement an action plan to resolve the problem or deficiency.

The Project Manager will appoint one attendee to record the discussions and decisions of the meeting. The meeting record will be documented in the form of meeting minutes and copies will be distributed to all affected parties. A copy of the minutes will be retained in facility records.

6. DOCUMENTATION

6.1 Overview

An effective CQA Plan depends largely on recognition of all construction activities that should be monitored and on assigning responsibilities for the monitoring of each activity. This is most effectively accomplished and verified by the documentation of quality assurance activities. The CQA Consultant will document that all quality assurance requirements have been addressed and satisfied.

The CQA Site Manager will provide the Project Manager with signed descriptive remarks, data sheets, and logs to verify that monitoring activities have been carried out. The CQA Site Manager will also maintain, at the job site, a complete file of *Drawings* and *Technical Specifications*, a CQA Plan, checklists, test procedures, daily logs, and other pertinent documents.

6.2 Daily Recordkeeping

Preparation of daily CQA documentation will consist of daily reports prepared by the CQA Site Manager which may include CQA monitoring logs, and testing data sheets. This information may be regularly submitted to and reviewed by the Project Manager.

The CQA Site Manager will prepare daily reports that document the activities observed during each day of activity. The daily reports may include monitoring logs and testing data sheets. At a minimum, these logs and data sheets will include the following information:

- the date, project name, location, and other identification;
- a summary of the weather conditions;
- a summary of locations where construction is occurring;
- equipment and personnel on the project;

- a summary of meetings held and attendees;
- a description of materials used and references of results of testing and documentation;
- identification of deficient work and materials;
- results of re-testing corrected “deficient work;”
- an identifying sheet number for cross referencing and document control;
- descriptions and locations of construction inspected;
- type of construction and inspection performed;
- description of construction procedures and procedures used to evaluate construction;
- a summary of test data and results;
- calibrations or re-calibrations of test equipment and actions taken as a result of re-calibration;
- decisions made regarding acceptance of units of work and/or corrective actions to be taken in instances of substandard testing results;
- a discussion of agreements made between the interested parties which may affect the work; and
- signature of the respective CQA Site Manager.

6.3 Construction Problems and Resolution Data Sheets

Construction Problems and Resolution Data Sheets, to be submitted with the daily reports prepared by the CQA Site Manager, describing special construction situations will be cross-referenced with daily reports, specific observation logs, and testing data sheets and will include the following information, where available:

- an identifying sheet number for cross-referencing and document control;
- a detailed description of the situation or deficiency;
- the location and probable cause of the situation or deficiency;
- how and when the situation or deficiency was found or located;
- documentation of the response to the situation or deficiency;
- final results of responses;
- measures taken to prevent a similar situation from occurring in the future; and
- signature of the CQA Site Manager and a signature indicating concurrence by the Project Manager.

The Project Manager will be made aware of significant recurring nonconformance with the *Drawings*, *Technical Specifications*, or CQA Plan. The cause of the nonconformance will be determined and appropriate changes in procedures or specifications will be recommended. These changes will be submitted to the Engineer for approval. When this type of evaluation is made, the results will be documented and any revision to procedures or specifications will be approved by the Contractor and Engineer.

A summary of supporting data sheets, along with final testing results and the CQA Site Manager's approval of the work, will be required upon completion of construction.

6.4 Photographic Documentation

Photographs will be taken and documented in order to serve as a pictorial record of work progress, problems, and mitigation activities. The basic file will contain color prints. Negatives will also be stored in a separate file in chronological order. These records will be presented to the Project Manager upon completion of the project. Photographic reporting data sheets, where used, will be cross-referenced with observation and testing data sheet(s), and/or construction problem and solution data sheet(s). Photographs used for documentation will be identified with the date, time, and location of the photograph.

6.5 Design and/or Specifications Changes

Design and/or specifications changes may be required during construction. In such cases, the CQA Site Manager will notify the Project Manager. Design and/or specification changes will be made with the written agreement of the Project Manager and the Engineer and will take the form of an addendum to the *Drawings* and *Technical Specifications*.

6.6 CQA Report

At the completion of the Project, the CQA Consultant will submit to the Project Manager the CQA report signed and sealed by the Professional Engineer licensed in the State of Nevada. The CQA report will acknowledge: (i) that the work has been performed in compliance with the *Drawings* and *Technical Specifications*; (ii) physical sampling and testing has been conducted at the appropriate frequencies; and (iii) that the summary document provides the necessary supporting information. At a minimum, this report will include:

- Manufacturers' quality control documentation;
- a summary report describing the CQA activities and indicating compliance with the *Drawings* and *Technical Specifications* which is signed and sealed by the CQA Officer;
- a summary of CQA/CQC testing, including failures, corrective measures, and retest results;
- contractor personnel resumes and qualifications;
- documentation that the geomembrane trial seams were performed in general accordance with the CQA Plan and *Technical Specifications*;
- documentation that field seams were non-destructively tested using a method in general accordance with the applicable test standards;
- documentation that nondestructive testing was monitored by the CQA Consultant, that the CQA Consultant informed the Geosynthetic Installer of any required repairs, and that the CQA Consultant inspected the seaming and patching operations for uniformity and completeness;
- records of sample locations, the name of the individual conducting the tests, and the results of tests;
- record drawings as provided by the Surveyor;
- documentation showing that piping was tested in general accordance with the *Technical Specifications*; and
- daily inspection reports.

The record drawings will include scale drawings depicting the location of the construction and details pertaining to the extent of construction (e.g., depths, plan dimensions, elevations, soil component thicknesses). Base maps required for

development of the record drawings and the record drawings will be prepared by a qualified Professional Land Surveyor registered in the State of Nevada. These documents will be reviewed by the CQA Consultant and included as part of the CQA Report.

7. EARTHWORKS

7.1 Introduction

This section prescribes the CQA activities to be performed to monitor that earthwork components are constructed in general accordance with *Drawings* and *Technical Specifications*. The earthworks construction procedures to be monitored by the CQA Consultant include:

- excavation;
- surcharge placement;
- engineered fill placement;
- anchor trench excavation and backfill;
- subgrade preparation; and
- operations layer material placement.

7.2 Testing Activities

Soil testing will be performed for material qualification, material conformance, and construction quality control (CQC). These three stages of testing are defined as follows:

- Material qualification tests are used to evaluate the conformance of a proposed soil source to the material specifications for qualification of the source prior to construction.

- Soils conformance testing is used to evaluate the conformance of a particular batch of soil from a qualified source to the material specifications prior to installation of the soil.

- CQC tests are performed on completed portions of the earthwork during construction to demonstrate that the placement procedures are resulting in a product that meets or exceeds both material and performance specifications.

The Contractor will be responsible for submitting material qualification test results to the Project Manager and to the CQA Site Manager for review. The CQA Laboratory will perform the conformance testing and CQC testing. Soil testing will be conducted in general accordance with the current versions of the corresponding American Society for Testing and Materials (ASTM) test procedures. The test methods indicated in Table 1 are those that will be used for this testing unless the test methods are updated or revised prior to construction. Revisions to the test methods will be reviewed and approved by the Engineer and the CQA Site Manager prior to their usage.

7.2.1 Sample Frequency

The frequency of soils testing for material qualification will conform to the minimum frequencies presented in Table 2. The frequency of soils testing for material conformance will conform to the minimum frequencies presented in Table 3. The actual frequency of testing required will be increased by the CQA Site Manager as necessary if variability of materials is noted at the site, during adverse conditions, or to isolate failing areas of the construction.

7.2.2 Sample or Test Location Selection

With the exception of qualification samples, sampling locations will be selected by the CQA Site Manager. Conformance samples will be obtained from borrow pits and/or stockpiles of material. The Contractor must plan the work and make soil available for sampling in a timely and organized manner so that the test results can be obtained before the material is installed. The CQA Site Manager must document sample locations so that failing areas can be immediately isolated. The CQA Site Manager will follow standard sampling procedures to obtain representative samples of the proposed soil materials.

CQC sample and test locations will be selected by the CQA Site Manager at the minimum test frequency specified in Table 4. Samples and test locations will generally be selected at random, however a special testing frequency will be used at the discretion of the CQA Site Manager when visual observations of construction performance indicate a potential problem. Additional testing for suspected areas will be considered when:

- rollers slip during rolling operation;

- lift thickness is greater than specified;
- fill is at improper and/or variable moisture content;
- less than specified number of roller passes are made;
- dirt-clogged rollers are used to compact the material;
- rollers may not have used optimum ballast;
- fill materials differ substantially from those specified;
- the degree of compaction is doubtful; and
- as directed by the Project Manager or the CQA Site Manager.

The frequency of testing may also be increased in the following situations:

- adverse weather conditions;
- breakdown of equipment;
- at the start and finish of grading;
- material fails to meet specifications; and
- the work area is reduced.

7.3 CQA Monitoring Activities

7.3.1 Earthwork

The CQA Site Manager will monitor and document the earthworks required for the Project. In general, monitoring the construction for earthwork includes the following activities:

- reviewing documentation of the material qualification test results provided by the Contractor;

- monitoring the prepared subgrade and subgrade surfaces for compliance with the *Technical Specifications* before geosynthetic materials are placed;

- sampling and testing for conformance of the materials to the *Technical Specifications*;

- documenting that the earthwork is constructed using the specified equipment and procedures;

- documenting that the earthwork is constructed to the lines and grades shown on the *Drawings*;

- monitoring that the construction activities do not cause damage to underlying geosynthetic materials;

- quality control testing to determine the acceptability of the work during construction; and

- monitoring the action of the compaction and heavy hauling equipment on the construction surface (i.e., penetration, pumping, cracking, etc.).

The specific activities required for CQA of each of the major soil components of the Liner System are presented in the following sections.

7.3.2 Engineered Fill Material

Monitoring the earthwork for the engineered fill material specifically includes the following:

- reviewing documentation of the qualification and conformance test results;

- monitoring soil for maximum particle size and deleterious materials;

- monitoring the thickness of lifts during placement of the materials;

- monitoring compaction operations; and

- measuring and recording the field density and the field moisture content of the in-place material.

7.3.3 Prepared Subgrade

During construction, the CQA Site Manager will monitor the prepared subgrade to document that the prepared subgrade soil characteristics are consistent with those specified in the *Technical Specifications*. The CQA Site Manager will monitor the construction activities to document that sharp rocks and other undesirable materials are removed and that the subgrade is prepared using the procedures and equipment specified in the *Technical Specifications*.

The upper portion of the subgrade can be damaged by excess moisture (causing softening) or insufficient moisture (causing desiccation and shrinkage). At a minimum, the CQA Site Manager will determine the suitability of the subgrade for geomembrane placement by:

- documenting that the surface is free of sharp rocks, debris and other undesirable materials;
- documenting that the surface is smooth, uniform, and free from desiccation cracks by visually monitoring proof rolling activities; and
- documenting that the subgrade surface meets the lines and grades shown on the *Drawings* by reviewing certified survey results.

7.3.4 Operations Layer Material

The CQA Site Manager will monitor the earthwork of the operations layer material for the following:

- the Contractor's submittals and qualification test results for consistency between the proposed methods and the approved methods;
- the conformance testing of the material and notifying the Contractor of results for compliance with material specifications;
- the thickness of lifts during placement;

- the placement equipment operation on the sideslopes is in general accordance with the *Technical Specifications*;

- the construction procedures to monitor that completed sections of liner and geomembrane are protected from damage; and

- the survey data to monitor that operations layer material is constructed to the proposed lines and grades and to the specified thickness.

7.4 Deficiencies

If a defect is discovered in the earthwork product, the CQA Site Manager will immediately determine the extent and nature of the defect. If the defect is indicated by an unsatisfactory test result, the CQA Site Manager will determine the extent of the deficient area by additional tests, observations, a review of records, or other means that the CQA Site Manager deems appropriate. If the defect is related to adverse site conditions, such as overly wet soils or surface desiccation, the CQA Site Manager will define the limits and nature of the defect.

7.4.1 Notification

After evaluating the extent and nature of a defect, the CQA Site Manager will notify the Project Manager and Contractor and schedule appropriate re-tests when the work deficiency is to be corrected.

7.4.2 Repairs and Re-Testing

At locations where the field testing indicates densities below the requirements of the specification, the failing area will be reworked. The Contractor will correct the deficiency to the satisfaction of the CQA Site Manager. If a project specification criterion cannot be met, or unusual weather conditions hinder work, then the CQA Site Manager will develop and present to the Engineer and/or Project Manager suggested solutions for his approval.

All re-tests recommended by the CQA Site Manager must verify that the defect has been corrected before any additional work is performed by the Contractor in the area of the deficiency. The CQA Site Manager will also verify that installation requirements are met and that submittals are provided.

8. DRAINAGE AGGREGATE

8.1 Introduction

This section prescribes the CQA activities to be performed to monitor that drainage aggregates are constructed in general accordance with *Drawings* and *Technical Specifications*. The drainage aggregates construction procedures to be monitored by the CQA Consultant include drainage aggregate placement.

8.2 Testing Activities

Aggregate testing will be performed for material qualification and material conformance. These two stages of testing are defined as follows:

- Material qualification tests are used to evaluate the conformance of a proposed aggregate source to the material specifications for qualification of the source prior to construction.

- Aggregate conformance testing is used to evaluate the conformance of a particular batch of aggregate from a qualified source to the material specifications prior to installation of the aggregate.

The Contractor will be responsible for submitting material qualification test results to the Project Manager and to the CQA Site Manager for review. The CQA Laboratory will perform the conformance testing and CQC testing. Aggregate testing will be conducted in general accordance with the current versions of the corresponding American Society for Testing and Materials (ASTM) test procedures. The test methods indicated in Table 5 are those that will be used for this testing unless the test methods are updated or revised prior to construction. Revisions to the test methods will be reviewed and approved by the Engineer and the CQA Site Manager prior to their usage.

8.2.1 Sample Frequency

The frequency of aggregate testing for material qualification will conform to the minimum frequencies presented in Table 6. The frequency of aggregate testing for material conformance will conform to the minimum frequencies presented in Table 7.

The actual frequency of testing required will be increased by the CQA Site Manager as necessary if variability of materials is noted at the site, during adverse conditions, or to isolate failing areas of the construction.

8.2.2 Sample Selection

With the exception of qualification samples, sampling locations will be selected by the CQA Site Manager. Conformance samples will be obtained from borrow pits and/or stockpiles of material. The Contractor must plan the work and make aggregate available for sampling in a timely and organized manner so that the test results can be obtained before the material is installed. The CQA Site Manager must document sample locations so that failing areas can be immediately isolated. The CQA Site Manager will follow standard sampling procedures to obtain representative samples of the proposed aggregate materials.

8.3 CQA Monitoring Activities

8.3.1 Drainage Aggregate

The CQA Site Manager will monitor and document the installation of the drainage aggregates. In general, monitoring the installation of the drainage aggregates includes the following activities:

- reviewing documentation of the material qualification test results provided by the Contractor;
- sampling and testing for conformance of the materials to the *Technical Specifications*;
- documenting that the drainage aggregates are installed using the specified equipment and procedures;
- documenting that the drainage aggregates are constructed to the lines and grades shown on the *Drawings*; and

- monitoring that the construction activities do not cause damage to underlying geosynthetic materials.

8.4 Deficiencies

If a defect is discovered in the drainage aggregates, the CQA Site Manager will evaluate the extent and nature of the defect. If the defect is indicated by an unsatisfactory test result, the CQA Site Manager will determine the extent of the deficient area by additional tests, observations, a review of records, or other means that the CQA Site Manager deems appropriate.

8.4.1 Notification

After evaluating the extent and nature of a defect, the CQA Site Manager will notify the Project Manager and Contractor and schedule appropriate re-tests when the work deficiency is to be corrected.

8.4.2 Repairs and Re-testing

The Contractor will correct the deficiency to the satisfaction of the CQA Site Manager. If a project specification criterion cannot be met, or unusual weather conditions hinder work, then the CQA Site Manager will develop and present to the Engineer and/or Project Manager suggested solutions for approval.

All re-tests recommended by the CQA Site Manager must verify that the defect has been corrected before any additional work is performed by the Contractor in the area of the deficiency. The CQA Site Manager will also verify that installation requirements are met and that submittals are provided.

9. HIGH DENSITY POLYETHYLENE (HDPE) PIPE AND FITTINGS

9.1 Material Requirements

HDPE pipe and fittings must conform to the requirements of the *Technical Specifications*. The CQA Consultant will document that the HDPE pipe and fittings meet those requirements through manufacturer's quality control certificates, conformance testing, and visual examination of materials arriving on site.

9.2 Manufacturer

9.2.1 Submittals

Prior to the installation of HDPE pipe, the Manufacturer will provide to the CQA Consultant:

- a properties' sheet including, at a minimum, all specified properties, measured using test methods indicated in the *Technical Specifications*, or equivalent; and

- a certification that property values given in the properties sheet are minimum values and are guaranteed by the Manufacturer.

The CQA Consultant will document that:

- the property values certified by the Manufacturer meet the *Technical Specifications*; and

- the measurements of properties by the Manufacturer are properly documented and that the test methods used are acceptable.

9.2.2 Identification

Prior to shipment, the Manufacturer will provide the Project Manager and the CQA Site Manager with a quality control certificate for each lot/batch of HDPE pipe provided. The quality control certificate will be signed by a responsible party

employed by the Manufacturer, such as the Production Manager. The quality control certificate will include:

- lot/batch numbers and identification; and
- sampling procedures and results of quality control tests.

The CQA Site Manager will:

- document that the quality control certificates have been provided at the specified frequency for all lots/batches of pipe, and that each certificate identifies the pipe lot/batch related to it; and

- review the quality control certificates and document that the certified properties meet the *Technical Specifications*.

9.3 Handling and Laying

Care will be taken during transportation of the pipe such that it will not be cut, kinked, or otherwise damaged.

Ropes, fabric, or rubber-protected slings and straps will be used when handling pipes. Chains, cables, or hooks inserted into the pipe ends will not be used. Two slings spread apart will be used for lifting each length of pipe. Pipe or fittings will not be dropped onto rocky or unprepared ground.

Pipes will be handled and stored in general accordance with the Manufacturer's recommendation. The handling of joined pipe will be in such a manner that the pipe is not damaged by dragging it over sharp and cutting objects. Slings for handling the pipe will not be positioned at butt-fused joints. Sections of the pipes with deep cuts and gauges will be removed and the ends of the pipe rejoined.

9.4 Joints

Lengths of pipe will be assembled into suitable installation lengths by the butt-fusion process. Butt-fusion means the butt-joining of the pipe by softening by heat the aligned faces of the pipe ends in a suitable apparatus and pressing them together under

controlled pressure. This process will be applied by personnel experienced with the process. Certification will be provided that the person performing this work is qualified by experience and instruction in the procedure. All pipe so joined will be made from the same class and type of raw material made by the same raw material supplier.

10. GEOMEMBRANE

10.1 General

This section discusses and outlines the CQA activities to be performed for high density polyethylene (HDPE) geomembrane installation. The CQA Site Manager will review the *Drawings*, and the *Technical Specifications*, and any approved Addenda regarding this material.

10.2 Geomembrane Material Conformance

10.2.1 Introduction

The CQA Site Manager will document that the geomembrane delivered to the site meets the requirements of the *Technical Specifications* prior to installation. The CQA Site Manager will:

- review the manufacturer's submittals for compliance with the *Technical Specifications*;
- document the delivery and proper storage of geomembrane rolls; and
- conduct conformance testing of the rolls before the geomembrane is installed.

The following sections describe the CQA activities required to verify the conformance of geomembrane.

10.2.2 Review of Quality Control

10.2.2.1 Material Properties Certification

The Manufacturer will provide the Project Manager and the CQA Site Manager with the following:

- a properties sheet including, at a minimum, all specified properties, measured using test methods indicated in the *Technical Specifications*, or equivalent;
- the sampling procedure and results of testing; and
- a certification that property values given in the properties sheet are guaranteed by the Manufacturer.

The CQA Site Manager will document that:

- the property values certified by the Manufacturer meet all of the *Technical Specifications*; and
- the measurements of properties by the Manufacturer are properly documented and that the test methods used are acceptable.

10.2.2.2 Resin Certification

The Manufacturer will also provide the Project Manager with the following information concerning the resin used to manufacture the geomembrane:

- the origin (Resin Supplier's name and resin production plant), identification (brand name, lot number), and production date of the resin; and
- the raw material quality control certificates.

The CQA Site Manager will:

- evaluate that the quality control certificates have been provided at the specified frequency, and that the certificate identifies the rolls related to it; and

- review the quality control certificates and evaluate that the certified properties meet the specifications.

10.2.2.3 Geomembrane Roll QC Certification

Prior to shipment, the Manufacturer will provide the Project Manager and the CQA Site Manager with a quality control certificate for every roll of geomembrane provided. The quality control certificate will be signed by a responsible party employed by the Geomembrane Manufacturer, such as the production manager. The quality control certificate will include:

- roll numbers and identification; and

- results of quality control tests - as a minimum, results will be given for thickness, specific gravity, carbon black content, carbon black dispersion, tensile properties, tear resistance, puncture resistance, and single point stress rupture evaluated in general accordance with the methods indicated in the specifications or equivalent methods approved by the Engineer.

The CQA Site Manager will:

- evaluate that the quality control certificates have been provided at the specified frequency, and that the certificate identifies the rolls related to the roll represented by the test results; and

- review the quality control certificates and evaluate that the certified roll properties meet the specifications.

10.2.3 Conformance Testing

Upon delivery of the rolls of geomembrane, the CQA Site Manager will document that the rolls are unloaded and stored on site as required by the *Technical Specifications*. Damage caused by unloading will be documented by the CQA Site Manager and the damaged material will not be installed. The CQA Site Manager shall obtain conformance samples at the specified frequency and forward them to the Geosynthetics CQA Laboratory for testing to monitor conformance to both the *Technical Specifications* and the list of properties certified by the Manufacturer. The test procedures will be as indicated in Table 8. Where optional procedures are noted in the test method, the requirements of the *Technical Specifications* will prevail.

Samples will be taken across the width of the roll and will not include the first linear 3 ft (1 m) of material. Unless otherwise specified, samples will be 3 ft (1 m) long by the roll width. The CQA Site Manager will mark the machine direction on the samples with an arrow along with the date and roll number. The required minimum sampling frequencies are provided in Table 8.

The CQA Site Manager will examine results from laboratory conformance testing and will report any non-conformance to the Project Manager and the Geosynthetic Installer. The procedure prescribed in the *Technical Specifications* will be followed in the event of a failing conformance test.

10.3 Delivery

10.3.1 Transportation and Handling

The CQA Site Manager will document that the transportation and handling does not pose a risk of damage to the geomembrane.

Upon delivery at the site, the Geosynthetic Installer and the CQA Site Manager will conduct a surface observation of the rolls for defects and damage. This

inspection will be conducted without unrolling unless defects or damages are found or suspected. The CQA Site Manager will indicate to the Project Manager:

- rolls, or portions thereof, which should be rejected and removed from the site because they have severe flaws; and

- rolls that include minor repairable flaws.

10.3.2 Storage

The Geosynthetic Installer will be responsible for the storage of the geomembrane on site. The Contractor will provide storage space in a location (or several locations) such that on-site transportation and handling are optimized if possible.

The CQA Site Manager will document that storage of the geomembrane provides adequate protection against sources of damage.

10.4 Geomembrane Installation

10.4.1 Introduction

The CQA Consultant will document that the geomembrane installation is carried out in general accordance with the *Drawings*, *Technical Specifications* and Manufacturer's recommendations.

10.4.2 Earthwork

10.4.2.1 Surface Preparation

The CQA Site Manager will document that:

- a qualified land surveyor has verified lines and grades;

- that the supporting prepared subgrade or subgrade meets the *Technical Specifications* and has been approved; and

- placement of the overlying materials does not damage, create large wrinkles, or induce excessive tensile stress in the underlying geosynthetic materials.

The Geosynthetic Installer will certify in writing that the surface on which the geomembrane will be installed is acceptable. The certificate of acceptance will be given by the Geosynthetic Installer to the Project Manager prior to commencement of geomembrane installation in the area under consideration. The CQA Site Manager will be given a copy of this certificate by the Project Manager.

After the supporting subgrade has been accepted by the Geosynthetic Installer, it will be the Geosynthetic Installer's responsibility to indicate to the Project Manager any change in the supporting soil condition that may require repair work. If the CQA Site Manager concurs with the Geosynthetic Installer, then the Project Manager will document that the supporting soil is repaired.

At any time before and during the geomembrane installation, the CQA Site Manager will indicate to the Project Manager locations that may not provide adequate support to the geomembrane.

10.4.2.2 Geosynthetic Termination

The CQA Site Manager will document that the geosynthetic terminations have been constructed in general accordance with the *Drawings*. Backfilling above the terminations will be conducted in general accordance with the *Technical Specifications*.

10.4.3 Geomembrane Placement

10.4.3.1 Panel Identification

A field panel is the unit area of geomembrane which is to be seamed in the field, i.e., a field panel is a roll or a portion of roll cut in the field. It will be the responsibility of the CQA Site Manager to document that each field panel is given an "identification code" (number or letter- number) consistent with the layout plan. This identification code will be agreed upon by the Project Manager, Geosynthetic Installer and CQA Site Manager. This field panel identification code will be as simple and

logical as possible. Roll numbers established in the manufacturing plant must be traceable to the field panel identification code.

The CQA Site Manager will establish documentation showing correspondence between roll numbers, and field panel identification codes. The field panel identification code will be used for all quality assurance records.

10.4.3.2 Field Panel Placement

Location

The CQA Site Manager will document that field panels are installed at the location indicated in the Geosynthetic Installer's layout plan, as approved or modified by the Engineer.

Installation Schedule

Field panels may be installed using one of the following schedules:

- all field panels are placed prior to field seaming in order to protect the subgrade from erosion by rain;
- field panels are placed one at a time and each field panel is seamed after its placement (in order to minimize the number of unseamed field panels exposed to wind); and
- any combination of the above.

If a decision is reached to place all field panels prior to field seaming, it is usually beneficial to begin at the high point area and proceed toward the low point with "shingle" overlaps to facilitate drainage in the event of precipitation. It is also usually beneficial to proceed in the direction of prevailing winds. Accordingly, an early decision regarding installation scheduling should be made if and only if weather conditions can be predicted with reasonable certainty. Otherwise, scheduling decisions must be made during installation, in general accordance with varying conditions. In any

event, the Geosynthetic Installer is fully responsible for the decision made regarding placement procedures.

The CQA Site Manager will evaluate every change in the schedule proposed by the Geosynthetic Installer and advise the Project Manager on the acceptability of that change. The CQA Site Manager will document that the condition of the supporting soil has not changed detrimentally during installation.

The CQA Site Manager will record the identification code, location, and date of installation of each field panel.

Weather Conditions

Geomembrane placement will not proceed unless otherwise authorized:

- when the ambient temperature is below 40°F or above 104°F;
- when the geomembrane sheet temperature is below 40°F or above 104°F; or
- when wind gusts are in excess of 20 mph.

Geomembrane placement will not be performed during any precipitation, in the presence of excessive moisture (e.g., fog, dew), in an area of ponded water, or in the presence of excessive winds (i.e., wind gusts in excess of 20 mph).

The CQA Site Manager will document that the above conditions are fulfilled. Additionally, the CQA Site Manager will document that the supporting soil has not been damaged by weather conditions. The Geosynthetics Installer will inform the Project Manager if the above conditions are not fulfilled.

Method of Placement

The CQA Site Manager will document the following:

- equipment used does not damage the geomembrane by handling, trafficking, excessive heat, leakage of hydrocarbons or other means;

- the surface underlying the geomembrane has not deteriorated since previous acceptance, and is still acceptable immediately prior to geomembrane placement;

- geosynthetic elements immediately underlying the geomembrane are clean and free of debris;

- personnel working on the geomembrane do not smoke, wear damaging shoes, or engage in other activities which could damage the geomembrane;

- the method used to unroll the panels does not cause scratches or crimps in the geomembrane and does not damage the supporting soil;

- the method used to place the panels minimizes wrinkles (especially differential wrinkles between adjacent panels); and

- adequate temporary loading and/or anchoring (e.g., sand bags, tires), not likely to damage the geomembrane, has been placed to prevent uplift by wind (in case of high winds, continuous loading, e.g., by adjacent sand bags, is recommended along edges of panels to minimize risk of wind flow under the panels).

The CQA Site Manager will inform the Project Manager if the above conditions are not fulfilled.

Damaged panels or portions of damaged panels that have been rejected will be marked and their removal from the work area recorded by the CQA Site Manager. Repairs will be made in general accordance with procedures described in Section 10.4.5.

10.4.4 Field Seaming

This section details CQA procedures to document that seams are properly constructed and tested in general accordance with the Manufacturer's specifications and industry standards.

10.4.4.1 Seam Layout

The Geosynthetic Installer will provide the Project Manager and the CQA Site Manager with a seam layout drawing, i.e., a drawing of the facility to be lined showing all expected seams. The CQA Site Manager will review the seam layout drawing and evaluate that it is consistent with the preliminary geomembrane panel layout. No panels may be seamed in the field without the Project Manager's approval. In addition, panels not specifically shown on the seam layout drawing may be used without the Project Manager's prior approval.

In general, seams should be oriented parallel to the line of maximum slope, i.e., oriented along, not across, the slope. In corners and odd-shaped geometric locations, the number of seams should be minimized. No horizontal seam should be less than 5 ft (1.5 m) from the toe of the slope, or areas of potential stress concentrations, unless otherwise authorized.

A seam numbering system compatible with the panel numbering system will be agreed upon at the Resolution and/or Pre-Construction Meeting.

10.4.4.2 Requirements of Personnel

All personnel performing seaming operations will be qualified by experience or by successfully passing seaming tests, as outlined in the *Technical Specifications*. The most experienced seamer, the "master seamer", will provide direct supervision over less experienced seamers.

The Geosynthetic Installer will provide the Project Manager and the CQA Site Manager with a list of proposed seaming personnel and their experience records. This document will be reviewed by the Project Manager and the Geosynthetics CQA Manager.

10.4.4.3 Seaming Equipment and Products

Approved processes for field seaming are fillet extrusion welding and fusion welding.

Fillet Extrusion Process

The fillet extrusion-welding apparatus will be equipped with gauges giving the temperature in the apparatus.

The Geosynthetic Installer will provide documentation regarding the extrudate to the Project Manager and the CQA Site Manager, and will certify that the extrudate is compatible with the specifications, and in any event is comprised of the same resin as the geomembrane sheeting.

The CQA Site Manager will log apparatus temperatures, ambient temperatures, and geomembrane surface temperatures at appropriate intervals.

The CQA Site Manager will document that:

- the Geosynthetic Installer maintains on site the number of spare operable seaming apparatus decided at the Resolution Meeting;
- equipment used for seaming is not likely to damage the geomembrane;
- the extruder is purged prior to beginning a seam until all heat-degraded extrudate has been removed from the barrel;
- the electric generator is placed on a smooth base such that no damage occurs to the geomembrane;
- a smooth insulating plate or fabric is placed beneath the hot welding apparatus after usage; and

- the geomembrane is protected from damage in heavily trafficked areas.

Fusion Process

The fusion-welding apparatus must be automated vehicular-mounted devices. The fusion-welding apparatus will be equipped with gauges giving the applicable temperatures and pressures.

The CQA Site Manager will log ambient, seaming apparatus, and geomembrane surface temperatures as well as seaming apparatus pressures.

The CQA Site Manager will also document that:

- the Geosynthetic Installer maintains on-site the number of spare operable seaming apparatus decided at the Resolution Meeting;

- equipment used for seaming is not likely to damage the geomembrane;

- for cross seams, the edge of the cross seam is ground to a smooth incline (top and bottom) prior to welding;

- the electric generator is placed on a smooth base such that no damage occurs to the geomembrane;

- a smooth insulating plate or fabric is placed beneath the hot welding apparatus after usage;

- the geomembrane is protected from damage in heavily trafficked areas; and

- a movable protective layer may be used directly below each overlap of geomembrane that is to be seamed to prevent build- up of moisture between the sheets.

10.4.4.4 Seam Preparation

The CQA Site Manager will document that:

- prior to seaming, the seam area is clean and free of moisture, dust, dirt, debris, and foreign material; and

- seams are aligned with the fewest possible number of wrinkles and "fishmouths."

10.4.4.5 Weather Conditions for Seaming

The normally required weather conditions for seaming are as follows unless authorized in writing by the Project Manager:

- seaming will only be approved between ambient temperatures of 40°F (4°C) and 104°F (40°C); and

- seaming will not be approved if sustained wind speed is in excess of 20 mph (32 km/hr).

If the Geosynthetic Installer wishes to use methods that may allow seaming at ambient temperatures below 40°F (4°C) or above 104°F (40°C), the Geosynthetic Installer will demonstrate and certify that such methods produce seams which are entirely equivalent to seams produced within acceptable temperature and wind requirements, and that the overall quality of the geomembrane is not adversely affected.

The CQA Site Manager will document that these seaming conditions are fulfilled and will advise the Project Manager if they are not. The Project Manager will then decide if the installation will be stopped or postponed.

10.4.4.6 Overlapping and Temporary Bonding

The CQA Site Manager will document that:

- the panels of geomembrane have a finished overlap of a minimum of 3 in. (75 mm) for both extrusion and fusion welding;

- no solvent or adhesive bonding material are to be used; and

- the procedure used to temporarily bond adjacent panels together does not damage the geomembrane.

The CQA Site Manager will log appropriate temperatures and conditions, and will log and report to the Project Manager non-compliances.

10.4.4.7 Trial Seams

Trial seams will be made on fragment pieces of geomembrane liner to verify that seaming conditions are adequate. Such trial seams will be made at the beginning of each seaming period, beginning of the day and after lunch, for each seaming apparatus used that day. Also, each seamer will make at least one trial seam each day. Trial seams will be made under the same conditions as actual seams.

Extrusion welded trial seam samples will be at least 3 ft (0.9 m) long by 1 ft (0.3 m) wide (after seaming) with the seam centered lengthwise. Fusion welded trial seam samples will be at least 5 ft (1.5 m) long by 1 ft (0.3 m) wide (after seaming) with the seam centered lengthwise. Seam overlap will be as indicated in Section 10.5.3.6.

Four specimens, each 1 in. (25 mm) wide, will be cut from the trial seam sample by the Geosynthetic Installer. One specimen will be tested for shear strength and three specimens will be tested for peel adhesion using a gauged tensiometer. All specimens tested will exhibit a Film Tear Bond (FTB) and will not fail in the seam. In addition, all specimens will meet or exceed the minimum strength requirements described in the *Technical Specifications*. If any of the four specimens fails, the entire trial seaming operation will be repeated. If any of the four additional specimens fails, the seaming apparatus and seamer will not be approved for production seaming until the deficiencies are corrected and two consecutive trial seam tests achieve the FTB requirements outlined above.

The CQA Site Manager will observe trial seam procedures. Trial seam samples will be assigned a number. The CQA Site Manager, will log the date, time, machine temperature(s), number of the seaming unit, name of the seamer, and pass or fail description for each trial seam sample tested.

10.4.4.8 General Seaming Procedure

Unless otherwise specified, the general seaming procedure used by the Geosynthetic Installer will be as follows:

- Fishmouths or wrinkles at the seam overlaps will be cut along the ridge of the wrinkle in order to achieve a flat overlap. The cut fishmouths or wrinkles will be seamed and any portion where the overlap is inadequate will then be patched with an oval or round patch of the same geomembrane extending a minimum of 6 in. (150 mm) beyond the cut in all directions.

- If seaming operations are carried out at night, adequate illumination will be provided at the Geosynthetic Installer's expense.

- Seaming will extend to the outside edge of panels to be placed in the anchor trench.

The CQA Site Manager will document that the above seaming procedures are followed, and will inform the Project Manager if they are not.

10.4.4.9 Nondestructive Seam Continuity Testing

Concept

The Geosynthetic Installer will non-destructively test field seams over their length using a vacuum test unit, air pressure test (for double fusion seams only), or other approved method. The purpose of nondestructive tests is to check the continuity of seams. It does not provide information on seam strength. Continuity testing will be carried out as the seaming work progresses, not at the completion of field seaming.

The CQA Site Manager will:

- observe continuity testing;

- record location, date, test unit number, name of person conducting the test, and the results of tests; and

- inform the Geosynthetic Installer and Project Manager of required repairs.

The Geosynthetic Installer will complete any required repairs in general accordance with Section 10.4.5.

The CQA Site Manager will:

- observe the repair and re-testing of the repair;
- mark on the geomembrane that the repair has been made; and
- document the results.

The following procedures will apply to locations where seams cannot be non-destructively tested:

All such seams will be cap-stripped with the same geomembrane.

- If the seam is accessible to testing equipment prior to final installation, the seam will be non-destructively tested prior to final installation.

- If the seam cannot be tested prior to final installation, the seaming and cap-stripping operations will be observed by the CQA Site Manager and Geosynthetic Installer for uniformity and completeness.

The seam number, date of observation, name of tester, and outcome of the test or observation will be recorded by the CQA Site Manager.

Vacuum Testing

The equipment will be comprised of the following:

- a vacuum box assembly consisting of a rigid housing, a transparent viewing window, a soft neoprene gasket attached to the bottom, port hole or valve assembly, and a vacuum gauge;
- a steel vacuum tank and pump assembly equipped with a pressure controller and pipe connections;
- a rubber pressure/vacuum hose with fittings and connections;
- an approved applicator; and
- a soapy solution.

The following procedures will be followed:

- energize the vacuum pump and reduce the tank pressure to approximately 5 psi (35 kPa) (10 in. of Hg.) gauge;
- wet a strip of geomembrane approximately 12 in. by 48 in. (0.3 m by 1.2 m) with the soapy solution;
- place the box over the wetted area;
- close the bleed valve and open the vacuum valve;
- document that a leak tight seal is created;
- for a period of not less than ten seconds, examine the geomembrane through the viewing window for the presence of leaks indicated by soap bubbles;

- if no leaks appear after ten seconds, close the vacuum valve and open the bleed valve, move the box over the next adjoining area with a minimum 3 in. (75 mm) overlap, and repeat the process;

- areas where soap bubbles appear will be marked and repaired in general accordance with Section 10.4.5 and retested using the vacuum testing method.

Air Pressure Testing (For Double-Track Fusion Seam Only)

The following procedures are applicable to those processes that produce a double seam with an enclosed space.

The equipment will be comprised of the following:

- an air pump (manual or motor driven) equipped with pressure gauge capable of generating and sustaining a pressure of 30 psi (200 kPa) and mounted on a cushion to protect the geomembrane;

- a rubber hose with fittings and connections;

- a sharp hollow needle, or other approved pressure feed device.

The following procedures will be followed:

- seal both ends of the seam to be tested;

- insert needle or other approved pressure feed device into the tunnel created by the fusion weld;

- insert a protective cushion between the air pump and the geomembrane;

- energize the air pump to a pressure of 25 to 30 psi (170 to 204 kPa), close valve, and sustain pressure for not less than 5 minutes;

- if loss of pressure exceeds 3 psi (20 kPa) or does not stabilize, locate faulty area and repair in general accordance with Section 10.4.5;

- cut end of tested seam area, opposite the location of the pressure gauge, after completion of the five minute pressure hold period to verify complete testing of the seam. If the pressure gauge does not indicate a release of pressure, locate blockage of the air channel and retest until entire seam is tested; and

- remove needle or other approved pressure feed device and repair any holes in the geomembrane resulting from the air pressure testing procedure in general accordance with Section 10.4.5.

10.4.4.10 Destructive Testing

Concept

Destructive seam testing will be performed on site and at the independent CQA laboratory in general accordance with the *Drawings* and the *Technical Specifications*. Destructive seam tests will be performed at selected locations. The purpose of these tests is to evaluate seam strength. Seam strength testing will be done as the seaming work progresses, not at the completion of all field seaming.

Location and Frequency

The CQA Site Manager will select locations where seam samples will be cut out for laboratory testing. Those locations will be established as follows.

- The frequency of geomembrane seam testing is a minimum of one destructive sample per 500 feet of weld. The minimum frequency is to be evaluated as an average taken throughout the entire facility.

- A minimum of one test per seaming machine over the duration of the project phase.

- Test locations will be evaluated during seaming at CQA Site Manager's discretion. Selection of such locations may be prompted by suspicion of excess crystallinity, contamination, offset welds, or any other potential cause of imperfect welding.

The Geosynthetic Installer will not be informed in advance of the locations where the seam samples will be taken.

Sampling Procedure

Samples will be cut by the Geosynthetic Installer as the seaming progresses in order to have laboratory test results before the geomembrane is covered by another material. The CQA Site Manager will:

- observe sample cutting;
- assign a number to each sample, and mark it accordingly;
- record sample location on layout drawing; and
- record reason for taking the sample at this location (e.g., statistical routine, suspicious feature of the geomembrane).

Holes in the geomembrane resulting from destructive seam sampling will be immediately repaired in general accordance with repair procedures described in Section 10.4.5. The continuity of the new seams in the repaired area will be tested in general accordance with Section 10.4.4.9.

Size and Distribution of Samples
